

MANUAL OF STANDARDS AIR TRAFFIC SERVICES NEPAL (MATS Nepal)

SECOND EDITION 2014 (2071 B.S.)

**This MATS Nepal incorporates latest amendments of relevant Civil
Aviation Requirements, ICAO Annexes and DOCs.**

**Civil Aviation Authority of Nepal
Babarmahal, Kathmandu
September 2014**

TABLE OF CONTENTS

| | |
|--|------------|
| CHAPTER 1. Definitions | 1 |
| CHAPTER 2. ATS safety management | 61 |
| 2.1 General | 61 |
| 2.2 Objectives | 61 |
| 2.3 ATS safety management activities | 62 |
| 2.4 Monitoring of safety levels | 62 |
| 2.5 Safety reviews | 63 |
| 2.6 Safety risk assessments | 65 |
| 2.7 Safety-enhancing measures | 65 |
| CHAPTER 3. ATS system capacity and air traffic flow management | 68 |
| 3.1 Capacity management | 68 |
| 3.2 Air traffic flow management | 70 |
| CHAPTER 4. General provisions for air traffic services | 73 |
| 4.1 Responsibility for the provision of air traffic control service | 73 |
| 4.2 Responsibility for the provision of flight information service and alerting service..... | 73 |
| 4.3 Division of responsibility for control between air traffic control units | 74 |
| 4.4 Flight plan | 76 |
| 4.5 Air traffic control clearances | 78 |
| 4.6 Horizontal speed control instructions | 83 |
| 4.7 Vertical speed control instructions | 86 |
| 4.8 Change from IFR to VFR flight | 87 |
| 4.9 Wake turbulence | 88 |
| 4.10 Altimeter setting procedures..... | 90 |
| 4.11 Position reporting | 95 |
| 4.12 Reporting of operational and meteorological information | 97 |
| 4.13 Presentation and updating of flight plan and control data | 103 |
| 4.14 Failure or irregularity of systems and equipment | 104 |
| CHAPTER 5. Separation methods and minima | 105 |
| 5.1 Introduction | 105 |
| 5.2 Provisions for the separation of controlled traffic | 105 |
| 5.3 Vertical separation | 106 |
| 5.4 Horizontal separation..... | 108 |
| 5.5 Separation of aircraft holding in flight | 148 |
| 5.6 Minimum separation between departing aircraft | 148 |
| 5.7 Separation of departing aircraft from arriving aircraft | 150 |
| 5.8 Time-based wake turbulence longitudinal separation minima | 152 |
| 5.9 Clearances to fly maintaining own separation while in visual meteorological conditions | 160 |
| 5.10 Essential traffic information | 161 |
| 5.11 Reduction in separation minima | 162 |

| | |
|--|----------------|
| CHAPTER 6. Separation in the vicinity of aerodromes | 164 |
| 6.1 Reduction in separation minima in the vicinity of aerodromes | 164 |
| 6.2 Essential local traffic | 164 |
| 6.3 Procedures for departing aircraft | 164 |
| 6.4 Information for departing aircraft | 169 |
| 6.5 Procedures for arriving aircraft | 170 |
| 6.6 Information for arriving aircraft | 181 |
| CHAPTER 7. Procedures for aerodrome control service | 185 |
| 7.1 Functions of aerodrome control towers | 185 |
| 7.2 Selection of runway-in-use | 187 |
| 7.3 Initial call to aerodrome control tower | 188 |
| 7.4 Information to aircraft by aerodrome control towers | 188 |
| 7.5 Essential information on aerodrome conditions | 195 |
| 7.6 Control of aerodrome traffic | 196 |
| 7.7 Control of traffic in the traffic circuit | 203 |
| 7.8 Order of priority for arriving and departing aircraft | 205 |
| 7.9 Control of departing aircraft | 205 |
| 7.10 Control of arriving aircraft | 208 |
| 7.11 Reduced runway separation minima between aircraft using the same runway | 209 |
| 7.12 Use of closed runway in emergency | 210 |
| 7.13 Use of a visual surveillance system in aerodrome control service | 210 |
| 7.14 Suspension of visual flight rules operations | 211 |
| 7.15 Authorization of special VFR flights | 211 |
| 7.16 Aeronautical ground lights | 212 |
| 7.17 Designation of hot spot(s) | 215 |
| CHAPTER 8. ATS surveillance services | 217 |
| 8.1 ATS surveillance systems capabilities..... | 217 |
| 8.2 Situation display | 219 |
| 8.3 Communications | 221 |
| 8.4 Provision of ATS surveillance services | 221 |
| 8.5 Use of SSR transponders and ADS-B transmitters | 222 |
| 8.6 General procedures | 227 |
| 8.7 Use of ATS surveillance systems in the air traffic control service | 238 |
| 8.8 Emergencies, hazards and equipment failures | 250 |
| 8.9 Use of ATS surveillance systems in the approach control service | 254 |
| 8.10 Use of ATS surveillance systems in the aerodrome control service | 258 |
| 8.11 Use of ATS surveillance systems in the flight information service | 260 |
| CHAPTER 9. Flight information service and alerting service | 262 |
| 9.1 Flight information service | 262 |
| 9.2 Alerting service | 265 |

| | |
|---|----------------|
| CHAPTER 10. Coordination | 279 |
| 10.1 Coordination in respect of the provision of air traffic control service | 268 |
| 10.2 Coordination in respect of the provision of flight information service and alerting service | 277 |
| 10.3 Coordination in respect of the provision of air traffic advisory service | 278 |
| CHAPTER 11. Air traffic services messages | 279 |
| 11.1 Categories of messages | 279 |
| 11.2 General provisions | 281 |
| 11.3 Methods of message exchange | 286 |
| 11.4 Message types and their application | 289 |
| CHAPTER 12. Phraseologies | 307 |
| 12.1 Communications procedures | 307 |
| 12.2 General | 307 |
| 12.3 ATC phraseologies | 309 |
| 12.4 ATS surveillance service phraseologies | 347 |
| 12.6 Automatic dependent surveillance — contract (ADS-C) phraseologies | 360 |
| 12.7 Alerting Phraseologies | 361 |
| CHAPTER 13. Automatic dependent surveillance — contract (ADS-C) services | 362 |
| 13.1 General | 362 |
| 13.2 ADS-C ground system capabilities | 362 |
| 13.3 ADS-C-related aeronautical information | 362 |
| 13.4 Use of ADS-C in the provision of air traffic control service | 362 |
| 13.5 Use of ADS-C in the application of separation minima | 363 |
| CHAPTER 14. Controller-pilot data link communications (CPDLC) | 368 |
| 14.1 General | 368 |
| 14.2 Establishment of CPDLC | 368 |
| CHAPTER 15. Procedures related to emergencies, communication failure and contingencies | 371 |
| 15.1 Emergency procedures | 371 |
| 15.2 Special procedures for in-flight contingencies in oceanic airspace | 377 |
| 15.3 Air-ground communications failure | 381 |
| 15.4 Assistance to VFR flights | 383 |
| 15.5 Other in-flight contingencies | 389 |
| 15.6 ATC contingencies | 391 |
| 15.7 Other ATC contingency procedures | 397 |
| 15.8 Procedures for ATS units when a volcanic ash cloud is reported or forecast | 398 |
| CHAPTER 16. Miscellaneous procedures | 399 |
| 16.1 Responsibility in regard to military traffic | 399 |
| 16.2 Responsibility in regard to unmanned free balloons | 399 |
| 16.3 Air traffic incident report | 402 |
| 16.4 Use of repetitive flight plans (RPLs) | 407 |

| | |
|---|-----|
| 16.5 Strategic lateral offset procedures (SLOP) | 409 |
| 16.6 Notification of suspected communicable diseases, or other public health risk, on board an aircraft | 409 |

APPENDICES

| | |
|---|-----|
| APPENDIX 1. Instructions for air-reporting by voice communications..... | 423 |
| APPENDIX 2. Flight plan | 435 |
| APPENDIX 3. Air traffic services messages | 470 |
| APPENDIX 4. Air traffic incident report | 531 |
| APPENDIX 5. Controller-pilot data link communications (CPDLC) message set | 539 |
| APPENDIX 6. ATS interfacility data communications (AIDC) messages | 541 |

FOREWORD

Pursuant to Rule-82, Schedule-3 of Civil Aviation Regulation. 2058 (2002), this "Manual of Standards Air Traffic Services, Nepal" referred here-in-after "MATS Nepal" has been developed and approved by Civil Aviation Authority of Nepal to comply with the provisions of the relevant Civil Aviation Requirements. ICAO Annexes and Documents for safety, regularity or efficiency of International Civil Aviation in Nepal.

The MATS Nepal is the national standards that prescribe the detail processes and procedures for Air Traffic Services in Nepal for the safety of air navigation. ATS and other concerned personnel are required to be familiar with the provision of this manual to perform their operational responsibilities.

This MATS Nepal, Second edition is issued and amended under the authority of Director General of CAAN to incorporate the provisions of:

1. Latest amendment of PANS ATM (Doc 4444, 15th Edition, 4th Amendment) and comes into force from April 2014
2. Public health emergency and ATC responsibilities
3. Responsibility of Chief of Airport for the provision of Air Traffic Services
4. ATC responsibility with regard to unauthorized entry into Nepalese Airspace
5. Provision of Unit Training Plan for OJT personnel.
6. This edition of MATS Nepal also incorporates latest amendments of relevant Civil Aviation Requirements, ICAO Annexes and other DOCs.

All earlier national legislations and requirements still stand valid as a part of this Manual of Standard for practical purposes.

Sanjiv Gautam
(Director General)

Civil Aviation Authority of Nepal

Amendment Record

Amendments and Corrigenda to this **"Manual of Standards Air Traffic Services Nepal"** are regularly issued by Director General of CAAN, Nepal. The space below is provided to keep a record of such amendments.

RECORD OF AMENDMENTS AND CORRIGENDA

[illegible][illegible]

Amendments to MATS Nepal

| <i>Amendment</i> | <i>Chapter</i> | <i>Subject</i> | <i>Date</i> |
|------------------------------|----------------|--|-------------------|
| 1 st Amendment | 16.11.2 | Provisions For Airport Operation | SEPTEMBER 2015 |
| | 16.11.6 | Provisions For Airport Operation | |
| | 16.13 | Control Room Discipline | |
| 2 nd Amendment | Appendix-5 | Air Traffic Services Incident Report | JANUARY 2016 |

INTRODUCTION

1. Manual of Standards - Air Traffic Services

- 1.1. The MATS prescribes the detailed technical provisions that contains standards, procedures, instructions and information which are intended to form the basis of air traffic services within the Kathmandu Flight Information Region. The air navigation services provider (ANSP) in Nepal is required to comply with the provisions contained in this manual. The ANSP shall document all the procedures including local procedures in their own ATS Operational Manuals (detail as mentioned in Chapter 14), to ensure the maintenance of and compliance with standards.
- 1.2. This Manual of Air Traffic Services, Nepal (MATS Nepal) refers to the standards and methods to be used in:
- a. providing Air Traffic Services within Nepalese airspace.
 - b. the requirements and standards mentioned hereunder are applicable for the service provider's organization, facilities and equipment, personnel, and check and training system, interface arrangements, safety management system and records.
- 1.3. The provision in this Manual are based on the Procedures for Air Navigation Services - Air Traffic Management (PANS-ATM) and CAR 11.
- 1.4. In addition to the Manual of Standards, the following may also be issued as and when required to supplement the Manual of Standards:
- a. Safety Directive - this is a mandatory requirement to be complied by the ANSP. It is published for purposes of immediate promulgation of local standards and recommendation practices in response to, but not limited to, amendments to ICAO Annexes. The Safety Directives will be incorporated into subsequent amendments of the Manual of Standards.
 - b. Safety Publication - this is published for purposes of promulgating supplementary guidance materials to the standards and recommended practices in the Manual of Standards. The publications are intended to provide recommendations and guidance to illustrate a means, but not necessarily the only means, of complying with the Manual of Standards. Safety Publications may explain certain regulatory

requirements by providing interpretive and explanatory materials.

- c. Information Circular - this is published for purposes of bringing to the attention of the ANSP educational materials related to aviation safety. The publications could be initiated as a result of ICAO State letters which do not require immediate changes to local regulations, new safety initiatives or international best practices as identified by Aviation safety and security regulation directorate. The ANSP is encouraged to review and adopt the materials if practicable. Where appropriate, the material in the publications may be incorporated into subsequent amendments of the Manual of Standards.

- 1.5. Where the ANSP is unable to comply with any provision in any of the Manuals of Standards, the ANSP shall inform the Aviation safety and security regulation directorate within a reasonable period of time and in writing. The ANSP shall examine the basis for its non-compliance and propose alternative steps to ensure that an equivalent level of safety is established. The Aviation safety and security regulation directorate will review the ANSP's proposal in a timely fashion and approve the proposal, subject to such other conditions it may impose. The ANSP is required to follow-up diligently and thereafter report to the Aviation safety and security regulation directorate within a reasonable period.
- 1.6. The ANSP shall ensure that the units of measurement as specified in the Manual of Standards- Units of Measurements to be used in Air and Ground Operations are used for the provision of air traffic services.
- 1.7. The **MATS Nepal** comprises Standards of uniform application, determined to be necessary for the safety of air navigation.

2. Differences between ICAO Standards and those in MATS

Where there is a difference between a standard prescribed in ICAO documents and the MATS, the MATS standard shall prevail.

3. Editorial Practices

To avoid the misunderstanding, the words "shall" is used within the requirements to indicate the compliance is compulsory, while "should" means that it is strongly advisable to carrying out the instruction which is recommended or discretionary.

4. Differences published in AIP

A list of significant differences from the MATS shall be included and published in AIP Nepal.

5. Related Documents

This manual should be read in conjunction with:

- 5.1. Civil Aviation Authority of Nepal Act 2053 (1996);
- 5.2. Civil Aviation Regulations, 2058 (2002); and Amendments
- 5.3. Civil Aviation Requirements (CAR-2) - Rules of the Air
- 5.4. Civil Aviation Requirements (CAR-11) - Air Traffic Services
- 5.5. Civil Aviation Requirements (CAR-10) - Aeronautical Telecommunication
- 5.6. Civil Aviation Requirements (CAR-15) - Aeronautical Information Service
- 5.7. Relevant ICAO Annexes, Documents and Circulars
- 5.8. AIP Nepal, AICs, Supplement and DGCA Directives.

6. MATS Nepal Documentation ownership and amendment procedures

- 6.1. The Air Navigation Services Safety Standards Department (ANSSSD) in CAAN Head Office has responsibility for the technical content of this **MATS Nepal**.
- 6.2. This MATS Nepal is issued, and can only be amended, under the authority of the Director General CAAN.
- 6.3. Suggested changes to this MATS Nepal shall be forwarded to the Director, ANSSSD Department.
- 6.4. Requests for any change to the content of this MATS Nepal may come from:
 - a. technical areas within CAAN; or
 - b. Air Navigation Service Providers (ANSPs), Airline or Aerodrome operators; or
 - c. individuals or authorization holders.
- 6.5. The need to change standards in this MATS Nepal may arise for any of the following reasons:
 - a. to ensure safety;
 - b. to ensure standardization;
 - c. to respond to changed CAAN safety standards;
 - d. to respond to ICAO prescription;

e. to accommodate proposed initiatives or new technologies.

6.6. CAAN may approve trials of new procedures or technologies in order to develop appropriate standards.

CHAPTER 1

DEFINITIONS AND ABBREVIATIONS

1.1 DEFINITIONS

When the following terms are used in the present document they have the following meanings:

Accepting unit/controller. Air traffic control unit/air traffic controller next to take control of an aircraft.

Note- See definition of “transferring unit/controller”.

Accident. An occurrence associated with the operation of an aircraft which, in the case of a manned aircraft, takes place between the time any person boards the aircraft with the intention of flight until such time as all such persons have disembarked, or in the case of an unmanned aircraft, takes place between the time the aircraft is ready to move with the purpose of flight until such time as it comes to rest at the end of the flight and the primary propulsion system is shut down, in which:

- a. a person is fatally or seriously injured as a result of:
 - being in the aircraft, or
 - direct contact with any part of the aircraft, including parts which have become detached from the aircraft, or
 - direct exposure to jet blast,

except when the injuries are from natural causes, self-inflicted or inflicted by other persons, or when the injuries are to stowaways hiding outside the areas normally available to the passengers and crew; or

- b. the aircraft sustains damage or structural failure which:
 - adversely affects the structural strength, performance or flight characteristics of the aircraft, and
 - would normally require major repair or replacement of the affected component, except for engine failure or damage, when the damage is limited to a single engine, (including its cowlings or accessories), to propellers, wing tips, antennas, probes, vanes, tires, brakes, wheels, fairings, panels, landing gear doors, windscreens, the aircraft skin (such as small

dents or puncture holes), or for minor damages to main rotor blades, tail rotor blades, landing gear, and those resulting from hail or bird strike (including holes in the radome); or

c. the aircraft is missing or is completely inaccessible.

Note 1.— For statistical uniformity only, an injury resulting in death within thirty days of the date of the accident is classified, by ICAO, as a fatal injury.

Note 2.— An aircraft is considered to be missing when the official search has been terminated and the wreckage has not been located.

Accuracy. A degree of conformance between the estimated or measured value and the true value.

Note.— For measured positional data the accuracy is normally expressed in terms of a distance from a stated position within which there is a defined confidence of the true position falling.

Aerodrome. A defined area on land or water (including any buildings, installations and equipment) intended to be used either wholly or in part for the arrival, departure and surface movement of aircraft.

Note.— The term “aerodrome” where used in the provisions relating to flight plans and ATS messages is intended to cover also sites other than aerodromes which may be used by certain types of aircraft, e.g. helicopters or balloons.

Aerodrome control service. Air traffic control service for aerodrome traffic.

Aerodrome control tower. A unit established to provide air traffic control service to aerodrome traffic.

Aerodrome elevation. The elevation of the highest point of the landing area.

Aerodrome traffic. All traffic on the maneuvering area of an aerodrome and all aircraft flying in the vicinity of an aerodrome.

Note.— An aircraft is in the vicinity of an aerodrome when it is in, entering or leaving an aerodrome traffic circuit.

Aerodrome traffic circuit. The specified path to be flown by aircraft operating in the vicinity of an aerodrome.

Aeronautical fixed service (AFS). A telecommunication service between specified fixed points provided primarily for the safety of air navigation and for the regular, efficient and economical operation of air services.

Aeronautical fixed station. A station in the aeronautical fixed service.

Aeronautical ground light. Any light specially provided as an aid to air navigation, other than a light displayed on an aircraft.

Aeronautical Information Publication (AIP). A publication issued by or with the authority of a State and containing aeronautical information of a lasting character essential to air navigation.

Aeronautical mobile service. A mobile service between aeronautical stations and aircraft stations, or between aircraft stations, in which survival craft stations may participate; emergency position indicating radio beacon stations may also participate in this service on designated distress and emergency frequencies.

Aeronautical station. A land station in the aeronautical mobile service. In certain instances, an aeronautical station may be located, for example, on board ship or on a platform at sea.

Aeronautical telecommunication station. A station in the aeronautical telecommunication service.

Airborne collision avoidance system (ACAS). An aircraft system based on secondary surveillance radar (SSR) transponder signals which operates independently of ground-based equipment to provide advice to the pilot on potential conflicting aircraft that are equipped with SSR

transponders.

Aircraft. Any machine that can derive support in the atmosphere from the reactions of the air other than the reactions of the air against the earth's surface.

Aircraft address. A unique combination of 24 bits available for assignment to an aircraft for the purpose of air-ground communications, navigation and surveillance.

Aircraft identification. A group of letters, figures or a combination thereof which is either identical to, or the coded equivalent of, the aircraft call sign to be used in air-ground communications, and which is used to identify the aircraft in ground-ground air traffic services communications.

Aircraft observation. The evaluation of one or more meteorological elements made from an aircraft in flight.

Aircraft proximity. A situation in which, in the opinion of a pilot or air traffic services personnel, the distance between aircraft as well as their relative positions and speed have been such that the safety of the aircraft involved may have been compromised. An aircraft proximity is classified as follows:

Risk of collision: The risk classification of an aircraft proximity in which serious risk of collision has existed.

Safety not assured: The risk classification of an aircraft proximity in which the safety of the aircraft may have been compromised.

No risk of collision: The risk classification of an aircraft proximity in which no risk of collision has existed.

Risk not determined: The risk classification of an aircraft proximity in which insufficient information was available to determine the risk involved, or inconclusive or conflicting evidence precluded such determination.

Air-ground communication. Two-way communication between aircraft and stations or locations on the surface of the earth.

AIRMET information. Information issued by a meteorological watch office concerning the occurrence or expected occurrence of specified en-route weather phenomena which may affect the safety of low-level aircraft operations and which was not already included in the forecast issued for low-level flights in the flight information region concerned or sub-area thereof.

AIRPROX. The code word used in an air traffic incident report to designate aircraft proximity.

Air-report. A report from an aircraft in flight prepared in conformity with requirements for position, and operational and/or meteorological reporting.

Air-taxiing. Movement of a helicopter/VTOL above the surface of an aerodrome, normally in ground effect and at a ground speed normally less than 37 km/h (20 kt).

Note.— The actual height may vary, and some helicopters may require air-taxiing above 8 m (25 ft) AGL to reduce ground effect turbulence or provide clearance for cargo sling loads.

Air-to-ground communication. One-way communication from aircraft to stations or locations on the surface of the earth.

Air Navigation Services. A generic term meaning variously, the Air Traffic Services, the Communication, Navigation and Surveillance (CNS) Services, the Meteorological Services for Air Navigation, the Search and Rescue (SAR) Services and the Aeronautical Information Services.

Air Navigation Service Provider. An Air Navigation Service Provider (ANSP) is an organization that provides the air navigation services for managing the aircraft in flight or on the maneuvering area of an aerodrome vested in it and which is the legitimate holder of that responsibility.

Note 1.- Civil Aviation Authority of Nepal, as an ANSP, is the responsible for the provision of Air Traffic Services, CNS Services and Aeronautical Information Services in Nepal.

Air traffic. All aircraft in flight or operating on the manoeuvring area of an aerodrome.

Air traffic advisory service. A service provided within advisory airspace to ensure separation, in so far as practical, between aircraft which are operating on IFR flight plans.

Air traffic control clearance. Authorization for an aircraft to proceed under conditions specified by an air traffic control unit.

Note 1.— For convenience, the term “air traffic control clearance” is frequently abbreviated to “clearance” when used in appropriate contexts.

Note 2.— The abbreviated term “clearance” may be prefixed by the words “taxi”, “take-off”, “departure”, “en-route”, “approach” or “landing” to indicate the particular portion of flight to which the air traffic control clearance relates.

Air traffic control instruction. Directives issued by air traffic control for the purpose of requiring a pilot to take a specific action.

Air traffic control service. A service provided for the purpose of:

- a. preventing collisions:
 - 1. between aircraft, and
 - 2. on the manoeuvring area between aircraft and obstructions; and
- b. expediting and maintaining an orderly flow of air traffic.

Air traffic control unit. A generic term meaning variously, area control centre, approach control unit or aerodrome control tower.

Air traffic flow management (ATFM). A service established with the objective of contributing to a safe, orderly and expeditious flow of air traffic by ensuring that ATC capacity is utilized to the maximum extent possible, and that the traffic volume is compatible with the capacities declared by the appropriate ATS authority.

Air traffic management (ATM). The dynamic, integrated management of air traffic and airspace including air traffic services, airspace management and air traffic flow management — safely,

economically and efficiently — through the provision of facilities and seamless services in collaboration with all parties and involving airborne and ground-based functions.

Air traffic management system. A system that provides ATM through the collaborative integration of humans, information, technology, facilities and services, supported by air and ground and/or space-based communications, navigation and surveillance.

Air traffic service (ATS). A generic term meaning variously, flight information service, alerting service, air traffic advisory service, air traffic control service (area control service, approach control service or aerodrome control service).

Air traffic services airspaces. Airspaces of defined dimensions alphabetically designated, within which specific types of flights may operate and for which air traffic services and rules of operation are specified.

Note.— ATS airspaces are classified as Class A to G as shown in CAR 11, Appendix 4.

Air traffic services reporting office. A unit established for the purpose of receiving reports concerning air traffic services and flight plans submitted before departure.

Note.— An air traffic services reporting office may be established as a separate unit or combined with an existing unit, such as another air traffic services unit, or a unit of the aeronautical information service.

Air traffic services unit. A generic term meaning variously, air traffic control unit, flight information centre or air traffic services reporting office.

Airway. A control area or portion thereof established in the form of a corridor.

ALERFA. The code word used to designate an alert phase.

Alerting service. A service provided to notify appropriate organizations regarding aircraft in need of

search and rescue aid, and assist such organizations as required.

Alert phase. A situation wherein apprehension exists as to the safety of an aircraft and its occupants.

Allocation, allocate. Distribution of frequencies, SSR codes, etc. to a State, unit or service. Distribution of 24-bit aircraft addresses to a State or common mark registering authority.

Alphanumeric characters (alphanumeric). A collective term for letters and figures (digits).

Alternate aerodrome. An aerodrome to which an aircraft may proceed when it becomes either impossible or inadvisable to proceed to or to land at the aerodrome of intended landing where the necessary services and facilities are available, where aircraft performance requirements can be met and which is operational at the expected time of use. Alternate aerodromes include the following:

Take-off alternate: An alternate aerodrome at which an aircraft would be able to land should this become necessary shortly after take-off and it is not possible to use the aerodrome of departure.

En-route alternate: An aerodrome at which an aircraft would be able to land after experiencing an abnormal or emergency condition while en route.

Destination alternate: An alternate aerodrome at which an aircraft would be able to land should it become either impossible or inadvisable to land at the aerodrome of intended landing.

Note.— The aerodrome from which a flight departs may also be an en-route or a destination alternate aerodrome for that flight.

Altitude. The vertical distance of a level, a point or an object considered as a point, measured from mean sea level (MSL).

Approach control service. Air traffic control service for arriving or departing controlled flights.

Approach control unit. A unit established to provide air traffic control service to controlled flights arriving at, or departing from, one or more aerodromes.

Approach sequence. The order in which two or more aircraft are cleared to approach to land at the aerodrome.

Appropriate ATS authority. The relevant authority designated by the State responsible for providing air traffic services in the airspace concerned.

Appropriate authority.

- a. Regarding flight over the high seas: The relevant authority of the State of Registry.
- b. Regarding flight other than over the high seas: The relevant authority of the State having sovereignty over the territory being overflown.

Apron. A defined area, on a land aerodrome, intended to accommodate aircraft for purposes of loading or unloading passengers, mail or cargo, fueling, parking or maintenance.

Apron management service. A service provided to regulate the activities and the movement of aircraft and vehicles on an apron.

Area control centre (ACC). A unit established to provide air traffic control service to controlled flights in control areas under its jurisdiction.

Area control service. Air traffic control service for controlled flights in control areas.

Area navigation (RNAV). A method of navigation which permits aircraft operation on any desired flight path within the coverage of ground- or space-based navigation aids or within the limits of the capability of self-contained aids, or a combination of these.

Note.— Area navigation includes performance-based navigation as well as other operations that do not meet the definition of performance-based navigation.

Area navigation route. An ATS route established for the use of aircraft capable of employing area navigation.

Assignment, assign. Distribution of frequencies to stations. Distribution of SSR codes or 24-bit aircraft addresses to aircraft.

ATIS. The symbol used to designate automatic terminal information service.

ATS route. A specified route designed for channelling the flow of traffic as necessary for the provision of air traffic services.

Note 1.— The term “ATS route” is used to mean variously, airway, advisory route, controlled or uncontrolled route, arrival or departure route, etc.

Note 2.— An ATS route is defined by route specifications which include an ATS route designator, the track to or from significant points (waypoints), distance between significant points, reporting requirements and, as determined by the appropriate ATS authority, the lowest safe altitude.

ATS surveillance service. A term used to indicate a service provided directly by means of an ATS surveillance system.

ATS surveillance system. A generic term meaning variously, ADS-B, PSR, SSR or any comparable ground-based system that enables the identification of aircraft.

Note.— A comparable ground-based system is one that has been demonstrated, by comparative assessment or other methodology, to have a level of safety and performance equal to or better than monopulse SSR.

Automatic dependent surveillance — broadcast (ADS-B). A means by which aircraft, aerodrome vehicles and other objects can automatically transmit and/or receive data such as identification, position and additional data, as appropriate, in a broadcast mode via a data link.

Automatic terminal information service (ATIS). The automatic provision of current, routine information to arriving and departing aircraft throughout 24 hours or a specified portion thereof:

Data link-automatic terminal information service (D-ATIS). The provision of ATIS via data link.

Voice-automatic terminal information service (Voice-ATIS). The provision of ATIS by means of continuous and repetitive voice broadcasts.

Base turn. A turn executed by the aircraft during the initial approach between the end of the outbound track and the beginning of the intermediate or final approach track. The tracks are not reciprocal.

Note.— Base turns may be designated as being made either in level flight or while descending, according to the circumstances of each individual procedure.

Blind transmission. A transmission from one station to another station in circumstances where two-way communication cannot be established but where it is believed that the called station is able to receive the transmission.

Broadcast. A transmission of information relating to air navigation that is not addressed to a specific station or stations.

Ceiling. The height above the ground or water of the base of the lowest layer of cloud below 6000 m (20 000 ft) covering more than half the sky.

Change-over point. The point at which an aircraft navigating on an ATS route segment defined by reference to very high frequency omnidirectional radio ranges is expected to transfer its primary navigational reference from the facility behind the aircraft to the next facility ahead of the aircraft.

Note.— Change-over points are established to provide the optimum balance in respect of signal strength and quality between facilities at all levels to be used and to ensure a common source of azimuth guidance for all aircraft operating along the same portion of a route segment.

Circling Approach. An extension of an instrument approach procedure which provides for visual circling of the aerodrome prior to landing.

Clearance limit. The point to which an aircraft is granted an air traffic control clearance.

Code (SSR). The number assigned to a particular multiple pulse reply signal transmitted by a transponder in Mode A or Mode C.

Common point. A point on the surface of the earth common to the paths of two aircraft, used as a basis for describing longitudinal separation minima (e.g. significant point, waypoint, navigation aid, fix).

Note.— Common point is not used for operational purposes or in pilot-controller communications.

Computer. A device which performs sequences of arithmetical and logical steps upon data without human intervention.

Note.— When the word “computer” is used in this document it may denote a computer complex, which includes one or more computers and peripheral equipment.

Control area. A controlled airspace extending upwards from a specified limit above the earth.

Controlled aerodrome. An aerodrome at which air traffic control service is provided to aerodrome traffic.

Note.— The term “controlled aerodrome” indicates that air traffic control service is provided to aerodrome traffic but does not necessarily imply that a control zone exists.

Controlled airspace. An airspace of defined dimensions within which air traffic control service is provided in accordance with the airspace classification

Note.— Controlled airspace is a generic term which covers ATS airspace Classes A, B, C, D and E as described in CAR 11, 2.6.

Controlled flight. Any flight which is subject to an air traffic control clearance.

Controller-pilot data link communications (CPDLC). A means of communication between controller and pilot, using data link for ATC communications.

Control zone. A controlled airspace extending upwards from the surface of the earth to a specified upper limit.

CPDLC message. Information exchanged between an airborne system and its ground counterpart. A CPDLC message consists of a single message element or a combination of message elements conveyed in a single transmission by the initiator.

CPDLC message set. A list of standard message elements and free text message elements.

Cruise climb. An aeroplane cruising technique resulting in a net increase in altitude as the aeroplane mass decreases.

Cruising level. A level maintained during a significant portion of a flight.

Current data authority. The designated ground system through which a CPDLC dialogue between a pilot and a controller currently responsible for the flight is permitted to take place.

Current flight plan (CPL). The flight plan, including changes, if any, brought about by subsequent clearances.

Note.— When the word “message” is used as a suffix to this term, it denotes the content and format of the current flight plan data sent from one unit to another.

Danger area. An airspace of defined dimensions within which activities dangerous to the flight of aircraft may exist at specified times.

Data convention. An agreed set of rules governing the manner or sequence in which a set of data may be combined into a meaningful communication.

Data link initiation capability (DLIC). A data link application that provides the ability to exchange addresses, names and version numbers necessary to initiate data link applications.

Data processing. A systematic sequence of operations performed on data.

Note.— Examples of operations are the merging, sorting, computing or any other transformation or rearrangement with the object of extracting or revising information, or of altering the representation of information.

Data quality. A degree or level of confidence that the data provided meets the requirements of the data user in terms of accuracy, resolution and integrity.

Datum. Any quantity or set of quantities that may serve as a reference or basis for the calculation of other quantities (ISO 19104¹).

Decision altitude (DA) or decision height (DH). A specified altitude or height in the precision approach or approach with vertical guidance at which a missed approach must be initiated if the required visual reference to continue the approach has not been established.

¹ ISO Standard 19104 - Geographic information- Terminology

Note 1.— Decision altitude (DA) is referenced to mean sea level and decision height (DH) is referenced to the threshold elevation.

Note 2.— The required visual reference means that section of the visual aids or of the approach area which should have been in view for sufficient time for the pilot to have made an assessment of the aircraft position and rate of change of position, in relation to the desired flight path. In Category III operations with a decision height the required visual reference is that specified for the particular procedure and operation.

Note 3.— For convenience where both expressions are used they may be written in the form “decision altitude/ height” and abbreviated “DA/H”.

Declared capacity. A measure of the ability of the ATC system or any of its subsystems or operating positions to provide service to aircraft during normal activities. It is expressed as the number of aircraft entering a specified portion of airspace in a given period of time, taking due account of weather, ATC unit configuration, staff and equipment available, and any other factors that may affect the workload of the controller responsible for the airspace.

Dependent parallel approaches. Simultaneous approaches to parallel or near-parallel instrument runways where ATS surveillance system separation minima between aircraft on adjacent extended runway centre lines are prescribed.

DETRESFA. The code word used to designate a distress phase.

Discrete code. A four-digit SSR code with the last two digits not being “00”.

Distress phase. A situation wherein there is reasonable certainty that an aircraft and its occupants are threatened by grave and imminent danger or require immediate assistance.

DME Separation. Spacing of aircraft in terms of distance determined by reference to distance measuring equipment

Elevation. The vertical distance of a point or a level, on or affixed to the surface of the earth, measured from mean sea level.

Emergency phase. A generic term meaning, as the case may be, uncertainty phase, alert phase or distress phase.

Estimated elapsed time. The estimated time required to proceed from one significant point to another.

Estimated off-block time. The estimated time at which the aircraft will commence movement associated with departure.

Estimated time of arrival. For IFR flights, the time at which it is estimated that the aircraft will arrive over that designated point, defined by reference to navigation aids, from which it is intended that an instrument approach procedure will be commenced, or, if no navigation aid is associated with the aerodrome, the time at which the aircraft will arrive over the aerodrome. For VFR flights, the time at which it is estimated that the aircraft will arrive over the aerodrome.

Expected approach time. The time at which ATC expects that an arriving aircraft, following a delay, will leave the holding fix to complete its approach for a landing.

Note.— The actual time of leaving the holding fix will depend upon the approach clearance

Expected onward clearance time. The time at which it is expected that an aircraft held enroute, will leave the holding point to continue on its flight.

Filed flight plan (FPL). The flight plan as filed with an ATS unit by the pilot or a designated representative, without any subsequent changes.

Note.— When the word “message” is used as a suffix to this term, it denotes the content and format of the filed flight plan data as transmitted.

Final approach. That part of an instrument approach procedure which commences at the specified final approach fix or point, or where such a fix or point is not specified,

- a. at the end of the last procedure turn, base turn or inbound turn of a racetrack procedure, if specified; or
- b. at the point of interception of the last track specified in the approach procedure; and ends at a point in the vicinity of an aerodrome from which:
 1. a landing can be made; or
 2. a missed approach procedure is initiated.

Flight crew member. A licensed crew member charged with duties essential to the operation of an aircraft during a flight duty period.

Flight information centre. A unit established to provide flight information service and alerting service.

Flight information region (FIR). An airspace of defined dimensions within which flight information service and alerting service are provided.

Flight information service. A service provided for the purpose of giving advice and information useful for the safe and efficient conduct of flights.

Flight level. A surface of constant atmospheric pressure which is related to a specific pressure datum, 1 013.2 hectopascals (hPa), and is separated from other such surfaces by specific pressure intervals.

Note 1.— A pressure type altimeter calibrated in accordance with the Standard Atmosphere:

- a. when set to a QNH altimeter setting, will indicate altitude;*
- b. when set to QFE altimeter setting, will indicate height above the QFE reference datum;*
- c. when set to a pressure of 1 013.2 hPa, may be used to indicate flight levels.*

Note 2.— The terms “height” and “altitude”, used in Note 1 above, indicate altimetric rather than geometric heights and altitudes.

Flight path monitoring. The use of ATS surveillance systems for the purpose of providing aircraft with information and advice relative to significant deviations from nominal flight path, including deviations from the terms of their air traffic control clearances.

Note.— Some applications may require a specific technology, e.g. radar, to support the function of flight path monitoring.

Flight plan. Specified information provided to air traffic services units, relative to an intended flight or portion of a flight of an aircraft.

Note.- Specifications of flight plan and the Model Flight Plan Form are contained in Appendix 2.

Flight visibility. The visibility forward from the cockpit of an aircraft in flight.

Flow control. Measures designed to adjust the flow of traffic into a given airspace, along a given route, or bound for a given aerodrome, so as to ensure the most effective utilization of the airspace.

Force landing. Landing performed not in accordance with flight plan, as a result of engine failure/or malfunctioning.

Forecast. A statement of expected meteorological conditions for a specified time or period, and for a specified area or portion of airspace.

Free text message element. Part of a message that does not confirm to any message element in the PANS-ATM (Doc 4444).

General air traffic. Flight operating in accordance with civil air traffic services procedures.

Geodetic datum. A minimum set of parameters required to define location and orientation of the local reference system with respect to the global reference system/frame.

Glide path. A descent profile determined for vertical guidance during a final approach.

Ground effect. A condition of improved performance (lift) due to the interference of the surface with the airflow pattern of the rotor system when a helicopter or other VTOL aircraft is operating near the ground.

Note.— Rotor efficiency is increased by ground effect to a height of about one rotor diameter for most helicopters.

Ground visibility. The visibility at an aerodrome, as reported by an accredited observer or by automatic systems.

Heading. The direction in which the longitudinal axis of an aircraft is pointed, usually expressed in degrees from North (true, magnetic, compass or grid).

Height. The vertical distance of a level, a point or an object considered as a point, measured from a specified datum.

Holding fix. A geographical location that serves as a reference for a holding procedure.

Holding procedure. A predetermined manoeuvre which keeps an aircraft within a specified airspace while awaiting further clearance.

Hot spot. A location on an aerodrome movement area with a history or potential risk of collision or runway incursion, and where heightened attention by pilots/drivers is necessary.

Human Factors principles. Principles which apply to aeronautical design, certification, training, operations and maintenance and which seek safe interface between the human and other system components by proper consideration to human performance.

Human performance. Human capabilities and limitations which have an impact on the safety and efficiency of aeronautical operations.

Identification. The situation which exists when the position indication of a particular aircraft is seen on a situation display and positively identified.

IFR. The symbol used to designate the instrument flight rules.

IFR flight. A flight conducted in accordance with the instrument flight rules. **IMC.** The symbol used to designate instrument meteorological conditions. **INCERFA.** The code word used to designate an uncertainty phase.

Incident. An occurrence, other than an accident, associated with the operation of an aircraft which affects or could affect the safety of operation.

Independent parallel approaches. Simultaneous approaches to parallel or near-parallel instrument runways where ATS surveillance system separation minima between aircraft on adjacent extended runway centre lines are not prescribed.

Independent parallel departures. Simultaneous departures from parallel or near-parallel instrument runways.

Initial approach segment. That segment of an instrument approach procedure between the initial approach fix and the intermediate approach fix or, where applicable, the final approach fix or point.

Instrument approach procedure (IAP). A series of predetermined manoeuvres by reference to flight instruments with specified protection from obstacles from the initial approach fix, or where applicable, from the beginning of a defined arrival route to a point from which a landing can be completed and thereafter, if a landing is not completed, to a position at which holding or en-route obstacle clearance criteria apply. Instrument approach procedures are classified as follows:

1. **Non-precision approach (NPA) procedure:** An instrument approach procedure design for 2D instrument approach operations type A.

Note.— Non-precision approach procedures may be flown using a continuous descent final approach (CDFA) Technique. CDFAs while advisory VNAV guidance calculated by on-board equipment are considered 3D instrument Approach operations. CDFAs with manual calculation of the required rate of descent are considered 2D instrument approach operations, For more information on CDFAs, refer to PANS-OPS (Doc. 8168) Volume I, Part II, Section 5.

2. **Approach procedure with vertical guidance (APV).** A performance-based navigation (PBN) instrument approach procedure designed for 3D instrument approach operations Type A.
3. **Precision approach (PA) procedure.** An instrument approach procedure based on navigation systems (ILS, MLS, GLS and SBAS Cat I) designed for 3D instrument approach operations Type A or B.

Instrument meteorological conditions (IMC). Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling, less than the minima specified for visual meteorological conditions.

Note 1. — The specified minima for visual meteorological conditions are contained in Chapter 3 of CAR 2

Note 2.— In a control zone, a VFR flight may proceed under instrument meteorological conditions if and as authorized by air traffic control.

Instrument runway. One of the following types of runways intended for the operation of aircraft using instrument approach procedures:

a. Non-precision Approach Runway.

An instrument runway served by visual aids and a non-visual aid providing at least directional guidance adequate for a straight-in approach.

b. Precision approach runway, category I.

An instrument runway served by ILS and visual aids intended for operations with a decision height not lower than 60 m (200 ft) and either a visibility not less than 800 m or a runway visual range not less than 550 m.

c. Precision approach runway, category II.

An instrument runway served by ILS and visual aids intended for operations with a decision height lower than 60 m (200 ft) but not lower than 30 m (100 ft) and a runway visual range not less than 300 m.

d. Precision approach runway, category III.

An instrument runway served by ILS to and along the surface of the runway and:

- A - intended for operations with a decision height lower than 30 m (100 ft), or no decision height and a runway visual range not less than 175 m.
- B - intended for operations with a decision height lower than 15 m (50 ft), or no decision height and a runway visual range less than 175 m but not less than 50 m.

C - intended for operations with no decision height and no runway visual range limitations.

Integrity (aeronautical data). A degree of assurance that an aeronautical data and its value has not been lost nor altered since the data origination or authorized amendment.

International NOTAM office. An office designed by a State for the exchange of NOTAM internationally.

Known traffic. Traffic which is in communication with or the current flight details and intentions of which are known to the controller concerned.

Landing area. That part of a movement area intended for the landing or take-off of aircraft.

Landing sequence. The order in which arriving aircraft are positioned for landing.

Level. A generic term relating to the vertical position of an aircraft in flight and meaning variously, height, altitude or flight level.

Location indicator. A four-letter code group formulated in accordance with rules prescribed by ICAO and assigned to the location of an aeronautical fixed station.

Log on address: A specified code used for data link logon to an ATS unit.

Manoeuvring area. That part of an aerodrome to be used for the take-off, landing and taxiing of aircraft, excluding aprons.

Message field. An assigned area of a message containing specified elements of data.

Meteorological information. Meteorological report, analysis, forecast, and any other statement relating to existing or expected meteorological conditions.

Meteorological office. An office designated to provide meteorological service for international

air navigation.

Meteorological report. A statement of observed meteorological conditions related to a specified time and location.

Minimum fuel. The term used to describe a situation in which an aircraft's fuel supply has reached a state where little or no delay can be accepted.

Note.— This is not an emergency situation but merely indicates that an emergency situation is possible, should any undue delay occur.

Minimum sector altitude. The lowest altitude which may be used under emergency conditions which will provide a minimum clearance of 300 metres above all objects located in an area

contained within a sector of a circle of 46 km (25 nm) radius centred on a radio aid to navigation.

Missed approach procedure. The procedure to be followed if the approach cannot be continued.

Mode (SSR). The conventional identifier related to specific functions of the interrogation signals transmitted by an SSR interrogator. There are four modes specified in Annex 10, Vol 4: A, C, S and intermode.

Movement area. That part of an aerodrome to be used for the take-off, landing and taxiing of aircraft, consisting of the manoeuvring area and the apron(s).

Navigation specification. A set of aircraft and flight crew requirements needed to support performance-based navigation operations within a defined airspace. There are two kinds of navigation specifications:

RNP specification. A navigation specification based on area navigation that includes the requirement for performance monitoring and alerting, designated by the prefix RNP, e.g. RNP 4, RNP APCH

RNAV specification. A navigation specification based on area navigation that does not include the requirement for performance monitoring and alerting, designated by the prefix RNAV, e.g. RNAV 5, RNAV 1.

Near-parallel runways. Non-intersecting runways whose extended centre lines have an angle of convergence/divergence of 15 degrees or less.

Next data authority. The ground system so designated by the current data authority through which an onward transfer of communications and control can take place.

Normal operating zone (NOZ). Airspace of defined dimensions extending to either side of an published instrument approach procedure final approach course or track. Only half of the normal operating zone adjacent to a no transgression zone (NTZ) is taken into account in independent parallel approaches.

NOTAM. A notice distributed by means of telecommunication containing information concerning the establishment, condition or change in any aeronautical facility, service, procedure or hazard, the timely knowledge of which is essential to personnel concerned with flight operations.

No transgression zone (NTZ). In the context of independent parallel approaches, a corridor of airspace of defined dimensions located centrally between the two extended runway centre lines, where a penetration by an aircraft requires a controller intervention to manoeuvre any threatened aircraft on the adjacent approach.

Obstacle. All fixed (whether temporary or permanent) and mobile objects, or parts thereof, that located on an area intended for the surface movement of aircraft or that extend above a defined surface intended to protect aircraft in flight.

Obstacle clearance altitude (OCA) or obstacle clearance height (OCH). The lowest altitude or the lowest height above the elevation of the relevant runway threshold or the aerodrome elevation as applicable, used in establishing compliance with appropriate obstacle clearance criteria.

Note 1.— Obstacle clearance altitude is referenced to mean sea level and obstacle clearance height is referenced to the threshold elevation or in the case of non-precision approaches to the aerodrome elevation or the threshold elevation if that is more than 2 m (7 ft) below the aerodrome elevation. An obstacle clearance height for a circling approach is referenced to the aerodrome elevation.

Note 2.— For convenience when both expressions are used they may be written in the form “obstacle clearance altitude/height” and abbreviated “OCA/H”.

Operational control. The exercise of authority over the initiation, continuation, diversion or termination of a flight in the interest of the safety of the aircraft and the regularity and efficiency of the flight.

Operator. A person, organization or enterprise engaged in or offering to engage in an aircraft operation.

Performance-based communication (PBC). Communication based on performance specifications applied to the provision of air traffic services

Note.-An RCP specification includes communication performance requirements that are allocated to System components in terms of the communication to be provided and associated transaction time, continuity, availability, integrity, safety and functionality needed for the proposed operation in the context of a particular airspace concept.

Performance-based navigation (PBN). Area navigation based on performance requirements for aircraft operating along an ATS route, on an instrument approach procedure or in a designated airspace *Note.-Performance requirements are expressed in navigation specifications (RNAV specification, RNP specification) in term of accuracy, integrity, continuity, availability and functionality needed for the proposed operation in the context in the particular airspace concept.*

Performance based surveillance (PBS). Surveillance based on performance specifications applied to the provision of air traffic services.

Note.—An RSP specification includes surveillance performance requirements that are allocated to system components in terms of the surveillance to be provided and associated data delivery time, continuity, availability, integrity, accuracy of the surveillance data, safety and functionality needed for the proposed operation in the context of a particular airspace concept.

Pilot-in-command. The pilot designated by the operator, or in the case of general aviation, the owner, as being in command and charged with the safe conduct of a flight.

Position indication. The visual indication, in non-symbolic and/or symbolic form, on a situation display, of the position of an aircraft, aerodrome vehicle or other object.

Position symbol. The visual indication in symbolic form, on a situation display, of the position of an aircraft, aerodrome vehicle or other object, obtained after automatic processing of positional data derived from any source.

Positive radio fix.

1. NDB or locator station (when propagation is normal); or
2. VOR station

Precision approach radar (PAR). Primary radar equipment used to determine the position of an aircraft during final approach, in terms of lateral and vertical deviations relative to a nominal approach path, and in range relative to touchdown.

Note.—Precision approach radars are designated to enable pilots of aircraft to be given guidance by radio communication during the final stages of the approach to land.

Pressure-altitude. An atmospheric pressure expressed in terms of altitude which corresponds to that pressure in the Standard Atmosphere.

Primary radar. A radar system which uses reflected radio signals.

Primary surveillance radar (PSR). A surveillance radar system which uses reflected radio

signals.

Procedural control. Term used to indicate that information derived from an ATS surveillance system is not required for the provision of air traffic control service.

Procedural separation. The separation used when providing procedural control.

Procedure turn. A manoeuvre in which a turn is made away from a designated track followed by a turn in the opposite direction to permit the aircraft to intercept and proceed along the reciprocal of the designated track.

Note 1.— Procedure turns are designated “left” or “right” according to the direction of the initial turn.

Note 2.— Procedure turns may be designated as being made either in level flight or while descending, according to the circumstances of each individual procedure.

Profile. The orthogonal projection of a flight path or portion thereof on the vertical surface containing the nominal track.

Prohibited area. An airspace of defined dimensions above the land areas or territorial waters of a state within which the flight of aircraft is prohibited.

PSR blip. The visual indication, in non-symbolic form, on a situation display of the position of an aircraft obtained by primary radar.

Quadrantal crusing. Specified crusing levels determined in relation to magnetic track within quadrants of the compass.

Radar. A radio detection device which provides information on range, azimuth and/or elevation of objects.

Radar approach. An approach in which the final approach phase is executed under the direction

of a controller using radar.

Radar clutter. The visual indication on a situation display of unwanted signals.

Radar contact. The situation which exists when the radar position of a particular aircraft is seen and identified on a situation display.

Radar handover. Transfer of responsibility for the control of aircraft between two controllers using radar, following identification of the aircraft by both controllers.

Radar separation. The separation used when aircraft position information is derived from radar sources.

Radar surveillance. Observation of the movements of aircraft on a radar display and the passing of advice and information to identified aircraft and, where appropriate, to other ATS units.

Radio Navigation service. A service providing guidance information or position data for the efficient and safe operation of aircraft supported by one or more radio navigation aids.

Radiotelephony. A form of radio communication primarily intended for the exchange of information in the form of speech.

Read back. A procedure whereby a receiving station repeat a received message or an appropriate thereof back to the transmitting station so as to obtain confirmation of correct reception.

Receiving unit/controller. Air traffic services unit/air traffic controller to which a message is sent.

Note.— See definition of “sending unit/controller”.

Repetitive flight plan (RPL). A flight plan related to a series of frequently recurring, regularly operated individual flights with identical basic features, submitted by an operator for retention and repetitive use by ATS units.

Reporting point. A specified geographical location in relation to which the position of an aircraft can be reported.

Required communication performance (RCP) specification. A set of requirements for air traffic service provision and associated ground equipment, aircraft, capability and operations needed to support performance based communication.

Required surveillance performance (RSP) specification. A set of requirements for air traffic service provision and associated ground equipment, aircraft, capability and operations needed to support performance based communication.

Rescue coordination centre. A unit responsible for promoting efficient organization of search and rescue services and for coordinating the conduct of search and rescue operations within a search and rescue region.

Rescue unit. A unit composed of trained personnel and provided with equipment suitable for the expeditious conduct of search and rescue.

RNP type. A containment value expressed as a distance in nautical miles from the intended position within which flights would be for at least 95 per cent of the total flying time.

Example.— RNP 4 represents a navigation accuracy of plus or minus 7.4 km (4 NM) on a 95 per cent containment basis.

Route segment. A route or portion of rout usually flown without an intermediate stop.

Runway. A defined rectangular area on a land aerodrome prepared for the landing and take-off of aircraft.

Runway-holding position. A designated position intended to protect a runway, an obstacle limitation surface, or an ILS/MLS critical/sensitive area at which taxiing aircraft and vehicles shall stop and hold, unless otherwise authorized by the aerodrome control tower.

Note.— In radiotelephony phraseologies, the expression “holding point” is used to designate the runway-holding position.

Runway incursion. Any occurrence at an aerodrome involving the incorrect presence of an aircraft, vehicle or person on the protected area of a surface designated for the landing and take-off of aircraft.

Runway visual range (RVR). The range over which the pilot of an aircraft on the centre line of a runway can see the runway surface markings or the lights delineating the runway or identifying its centre line.

Safety case. A safety case provides documented evidence and argument that a service or facility, or a proposed change to the design of a service or facility, meets safety objectives or levels for the service or facility.

Safety management system (SMS). A systematic approach to managing safety, including the necessary organizational structures, accountabilities, policies and procedures.

Safety programme. An integrated set of regulations and activities aimed at improving safety.

Search area. The area in which an aircraft is believed to have crashed or forced landed.

Secondary radar. A radar system wherein a radio signal transmitted from the radar station initiates the transmission of a radio signal from another station.

Secondary surveillance radar (SSR). A surveillance radar system which uses transmitters/receivers (interrogators) and transponders.

Sending unit/controller. Air traffic services unit/air traffic controller transmitting a message.

Note.— See definition of “receiving unit/controller”.

SIGMET information. Information issued by a meteorological watch office concerning the

occurrence or expected occurrence of specified en-route weather and other phenomena in the atmosphere that may affect the safety of aircraft operations.

Significant point. A specified geographical location used in defining an ATS route or the flight path of an aircraft and for other navigation and ATS purposes.

Note.— There are three categories of significant points: ground-based navigation aid, intersection and waypoint. In the context of this definition, intersection is a significant point expressed as radials, bearings and/or distances from ground-based navigation aids.

Situation display. An electronic display depicting the position and movement of aircraft and other information as required.

Special VFR flight. A VFR flight cleared by air traffic control to operate within a control zone in meteorological conditions below VMC.

SSR response. The visual indication, in non-symbolic form, on a situation display, of a response from an SSR transponder in reply to an interrogation.

Standard instrument arrival (STAR). A designated instrument flight rule (IFR) arrival route linking a significant point, normally on an ATS route, with a point from which a published instrument approach procedure can be commenced.

Standard instrument departure (SID). A designated instrument flight rule (IFR) departure route linking the aerodrome or a specified runway of the aerodrome with a specified significant point, normally on a designated ATS route, at which the en-route phase of a flight commences.

Standard message element. Part of a message defined in the PANS-ATM (Doc 4444) in terms of display format, intended use and attributes.

Stop way. A defined rectangular area on the ground at the end of take-off run available prepared as a suitable area in which an aircraft can be stopped in the case of an abandoned take-off.

Surveillance radar. Radar equipment used to determine the position of an aircraft in range and azimuth.

Surveillance radar approach. An approach to an aerodrome or a runway by an aircraft under the direction of a radar controller using surveillance radar.

Taxiing. Movement of an aircraft on the surface of an aerodrome under its own power, excluding take-off and landing.

Taxiway A defined path on a land aerodrome established for the taxiing of aircraft and intended to provide a link between one part of the aerodrome and another, including:

- a. **Aircraft stand taxi lane.** A portion of an apron designated as a taxiway and intended to provide access to aircraft stands only.
- b. **Apron taxiway.** A portion of a taxiway system located on an apron and intended to provide a through taxi route across the apron.
- c. **Rapid exit taxiway.** A taxiway connected to a runway at an acute angle and designed to allow landing aeroplanes to turn off at higher speeds than are achieved on other exit taxiways thereby minimizing runway occupancy times.

Terminal control area (TMA). A control area normally established at the confluence of ATS routes in the vicinity of one or more major aerodromes.

Threshold. The beginning of that portion of the runway usable for landing.

Time difference of arrival (TDOA). The difference in relative time that a transponder signal from the same aircraft (or ground vehicle) is received at different receivers.

Total estimated elapsed time. For IFR flights, the estimated time required from take-off to arrive over that designated point, defined by reference to navigation aids, from which it is intended that an

instrument approach procedure will be commenced, or, if no navigation aid is associated with the destination aerodrome, to arrive over the destination aerodrome. For VFR flights, the estimated time required from take-off to arrive over the destination aerodrome.

Touchdown. The point where the nominal glide path intercepts the runway.

Note.— “Touchdown” as defined above is only a datum and is not necessarily the actual point at which the aircraft will touch the runway.

Track. The projection on the earth’s surface of the path of an aircraft, the direction of which path at any point is usually expressed in degrees from North (true, magnetic or grid).

Traffic avoidance advice. Advice provided by an air traffic services unit specifying manoeuvres to assist a pilot to avoid a collision.

Traffic information. Information issued by an air traffic services unit to alert a pilot to other known or observed air traffic which may be in proximity to the position or intended route of flight and to help the pilot avoid a collision.

Transfer of control. Transfer of responsibility for providing air traffic control service.

Transfer of control point. A defined point located along the flight path of an aircraft, at which the responsibility for providing air traffic control service to the aircraft is transferred from one control unit or control position to the next.

Transferring unit/controller. Air traffic control unit/air traffic controller in the process of transferring the responsibility for providing air traffic control service to an aircraft to the next air traffic control unit/air traffic controller along the route of flight.

Note.— See definition of “accepting unit/controller”.

Transition altitude. The altitude at or below which the vertical position of an aircraft is controlled by reference to altitudes.

Transition layer. The airspace between the transition altitude and the transition level.

Transition level. The lowest flight level available for use above the transition altitude.

Uncertainty phase. A situation wherein uncertainty exists as to the safety of an aircraft and its occupants.

Unlawful interference. An unlawful attempt, successful or otherwise, being made to take over control of an aircraft, or any act of violence against an aircraft being committed, attempted or threatened.

Unmanned free balloon. A non-power-driven, unmanned, lighter-than-air aircraft in free flight.

Note.— Unmanned free balloons are classified as heavy, medium or light in accordance with specifications contained in CAR 2, Appendix 5.

Vectoring. Provision of navigational guidance to aircraft in the form of specific headings, based on the use of an ATS surveillance system.

VFR. The symbol used to designate the visual flight rules.

VFR flight. A flight conducted in accordance with the visual flight rules.

Video mapping. The electronic superimposing of a map or plan on a radar display.

Visibility. Visibility for aeronautical purposes is the greater of:

- a) the greatest distance at which a black object of suitable dimensions, situated near the ground, can be seen and recognized when observed against a bright background;
- b) the greatest distance at which lights in the vicinity of 1 000 candelas can be seen and identified against an unlit background.

Note 1.— The two distances have different values in air of a given extinction coefficient, and the

latter b) varies with the background illumination. The former a) is represented by the meteorological optical range (MOR).

Note 2.— The definition applies to the observations of visibility in local routine and special reports, to the observations of prevailing and minimum visibility reported in METAR and SPECI and to the observations of ground visibility.

Visual approach. An approach by an IFR flight when either part or all of an instrument approach procedure is not completed and the approach is executed in visual reference to terrain.

Visual meteorological conditions. Meteorological conditions expressed in terms of visibility, distance from cloud, and ceiling, equal to or better than specified minima.

Note.— The specified minima are contained in CAR 2, Chapter 4.

Visual surveillance system. An electro-optical system providing an electronic visual presentation of traffic and any other information necessary to maintain situational awareness as an aerodrome and its vicinity.

VMC. The symbol used to designate visual meteorological conditions.

Wake turbulence conditions. The disturbance to the surrounding atmosphere created by an operating aircraft and may be used to refer to any or all of the following:

- a. jet-engine blast
- b. prop wash
- c. wing-tip vortices
- d. rotor vortices

Waypoint A specified geographical location used to define an area navigation route or the flight path of an aircraft employing area navigation. Waypoints are identified as either:

Fly-by waypoint: A waypoint which requires turn anticipation to allow tangential interception of the next segment of a route or procedure, or

Flyover waypoint: A waypoint at which a turn is initiated in order to join the next segment of a route or procedure.

Wind shear. A change in wind speed and/or direction in space, including updrafts and downdrafts.

1.2 Abbreviations

Unless otherwise stated, abbreviations in this MATS Nepal have the meanings as follows:

A

| | |
|-------|---|
| AA | All after |
| A/A | Air-to-air |
| AAL | Above Aerodrome Level |
| AB | All before..... |
| ABM | Abeam |
| ABT | About |
| AC | Altostratus |
| ACAS | Airborne Collision Avoidance System |
| ACC | Area Control Centre |
| ACCID | Initial Notification of Aircraft accident |
| ACFT | Aircraft |
| ACK | Acknowledge |
| ACP | Acceptance (message type designator) |
| ACPT | Accept or Accepted |
| ACT | Active or activated or activity |
| AD | Aerodrome |
| ADA | Advisory area |
| ADDN | Addition or additional |
| ADF | Automatic direction-finding equipment |
| ADIZ | Air Defense Identification Zone |
| ADJ | Adjacent |
| ADR | Advisory route |

| | |
|--------|--|
| ADS | Automatic Dependent Surveillance |
| ADS-B | ADS- Broadcast |
| ADS-C | ADS- Contract |
| ADZ | Advise |
| AFIL | Flight Plan Filed in the Air |
| AFIS | Aerodrome Flight Information Service |
| AFM | Yes, Affirm |
| AFS | Aeronautical Fixed Service |
| AFT | After (time or place) |
| AFTN | Aeronautical Fixed Telecommunication Network |
| A/G | Air-to-ground aids |
| AGA | Aerodrome, air routes & ground aids |
| AGL | Above ground level |
| AGN | Again |
| AIC | Aeronautical Information Circular |
| AIP | Aeronautical Information Publication |
| AIRAC | Aeronautical Information Regulation and Control AIREP Air-report |
| AIS | Aeronautical Information Service |
| ALA | Alighting Area |
| ALERFA | Alert Phase |
| ALM | Aircraft Landing Minima |
| ALR | Alerting (Message type designator) |
| ALS | Approach Lighting System |
| ALT | Altitude |
| ALTN | Alternate (aerodrome) |
| AMD | Amend or amended |
| AMS | Aeronautical Mobile Service |
| AMSL | Above Mean Sea Level |
| ANSP | Air Navigation Services Provider |
| AP | Airport |
| APCH | Approach |

| | |
|--------|--|
| APP | Approach Control Office or Approach control or Approach Control Service or Approach Control Centre |
| APR | April |
| APRX | Approximate or approximately |
| APV | Approved, approve |
| ARFOR | Area forecast (in aeronautical meteorological code) |
| ARMET | Forecast upper wind and temperature at specified points (in aeronautical meteorological code) |
| ARO | Air Traffic Services Reporting Office |
| ARP | Aerodrome Reference Point |
| ARQ | Automatic Error Correction |
| ARR | Arrival (message type designator) |
| ARR | Arrive or arrival |
| AS | Altostratus |
| ASC | Ascent to or ascending to |
| ASDA | Accelerate-stop distance available |
| ASPH | Asphalt |
| ATA | Actual time of arrival |
| ATC | Air Traffic Control (in general) |
| ATD | Actual Time of Departure |
| ATFM | Air Traffic Flow Management |
| ATIS | Automatic Terminal Information Service |
| ATM | Air Traffic Management |
| ATN | Aeronautical Telecommunication Network |
| ATP | At (time or place) |
| ATS | Air Traffic Service(s) |
| ATTN | Attention |
| ATZ | Aerodrome Traffic Zone |
| AUG | August |
| AUX | Auxiliary |
| AVASIS | Abbreviated visual approach slope indicator system |

| | |
|----------|---|
| AVBL | Available or availability |
| AVG | Average |
| AVGAS | Aviation gasoline |
| AWK | Aerial work |
| AWY | Airway |
| AZM | Azimuth |
| B | |
| BA | Braking Action |
| C | |
| C | Degree Celsius (Centigrade) |
| CAT | Clear Air Turbulence |
| CAVOK | Visibility, cloud and present weather better than prescribed values or conditions |
| CB | Cumulonimbus |
| CC | Cirrocumulus |
| CD | Candela |
| CDN | Co-ordination (message type designator) |
| CFM | Confirm or I confirm |
| CHG | Modification (message type designator) |
| CI | Cirrus |
| CIT | Near or over large towns/city |
| CIV | Civil |
| CK | Check |
| CL | I am closing my station |
| CLA | Clear type of ice formation |
| CLBR | Calibration |
| CLD | Cloud |
| CLR | Clear or cleared to .. or clearance |
| CLSD | Closed |
| CM | Centimeter |

| | |
|----------|---|
| CMB | Climb to, or Climbing to |
| CMPL | Completion or completed or complete |
| CNL | Flight plan cancellation (message type designator) |
| CNL | Cancel or cancelled |
| CNS | Communications, Navigation and Surveillance |
| COM | Communications |
| CON | Console |
| CONC | Concrete |
| CONST | Construction or constructed |
| CONT | Continue or continued |
| COP | Change Over Point |
| COR | Correct or corrected or correction |
| COV | Cover or covered or covering |
| CPL | Current flight plan (message type designator) |
| CS | Call sign (used to request a call sign) |
| CS | Cirrostratus |
| CTA | Control area |
| CTAM | Climb to and maintain |
| CTL | Control |
| CTN | Caution |
| CTR | Control zone |
| CU | Cumulus |
| CUF | Cumuliform |
| CW | Continuous wave |
| CWY | Clearway |
| D | |
| D | Danger area (followed by identification) |
| DA | Decision altitude |
| DATIS | Data Link Automatic Terminal Information Service |
| DCKG | Docking |
| DCT | Direct (in relation to flight plan clearances and type of approach) |

| | |
|------|-------------------------------------|
| DEC | December |
| DEG | Degree |
| DEP | Depart or departure |
| DEP | Departure (message type designator) |
| DES | Descend to or descending to |
| DEST | Destination DETRESFA Distress phase |
| DFTI | Distance from touchdown indicator |
| DH | Decision height |
| DIF | Diffuse |
| DIST | Distance |
| DLA | Delay (message type designator) |
| DLA | Delay or delayed |
| DME | Distance measuring equipment |
| DNG | Danger or dangerous |
| DOC | Document |
| DOM | Domestic |
| DPT | Dew Point temperature |
| DR | Dead reckoning |
| DSB | Double side band |
| DTAM | Descend to and maintain |
| DTG | Date-time-group |
| DTRT | Deteriorate or deteriorating |
| DTW | Dual tandem wheels |
| DU | Dust |
| DUC | Dense upper cloud |
| DUPE | This is duplicate message |
| DUR | Duration |
| DVOR | Doppler VOR |
| DW | Dual wheels |
| DZ | Drizzle |

E

| | |
|----------|---|
| E | East or eastern longitude |
| EAT | Estimated approach time |
| EET | Estimated elapse time |
| EFC | Expected Further Clearance |
| EHF | Extremely high frequency 300000 KHZ to 300000MHZ |
| ELBA | Emergency location beacon aircraft |
| ELEV | Elevation |
| ELR | Extra-long range |
| ELT | Emergency locator transmitter |
| EM | Emission |
| EMBD | Embedded in a layer (to indicate cumulonimbus embedded in layers of other clouds) |
| EMERG | Emergency |
| ENE | East north east |
| ENRT | En-route |
| EOBT | Estimated off-block time |
| EQPT | Equipment |
| ESE | East south east |
| EST | Estimate or estimated or estimate (as message type designator) |
| ETA | Estimated time of arrival or estimating arrival |
| ETD | Estimated time departure or estimating departure |
| ETO | Estimated time over significant point |
| EV | Every |
| EXC | Except |
| EXER | Exercises or exercising or to exercise |
| EXP | Expect or expected or expecting |
| EXTD | Extend or extending |
| F | |
| F | Fixed |
| F | Degree Fahrenheit |
| FAC | Facilities |

| | |
|-------|---|
| FAF | Final approach fix |
| FAL | Facilitation |
| FAP | Final approach point |
| FAS | Final Approach Segment |
| FATO | Final approach and take-off area |
| FAX | Facsimile transmission |
| FBL | Light (used to qualify icing, turbulence, interference or static reports) |
| FC | Funnel cloud |
| FCST | Forecast |
| FEB | March |
| FG | Fog |
| FIC | Flight information centre |
| FIR | Flight information region |
| FIS | Flight information service |
| FISA | Automatic flight information service |
| FL | Flight level |
| FLG | Flashing |
| FLR | Flare |
| FLT | Flight |
| FLTCK | Flight check |
| FLW | Follow(s) or Following |
| FLY | Fly or flying |
| FM | From |
| FMS | Flight Management System |
| FNA | Final approach |
| FPL | Filed flight plan (message type designator) |
| FPM | Feet per minute |
| FREQ | Frequency |
| FRI | Friday |
| FRNG | Firing |
| FRONT | Front (relating to weather) |

| | |
|----------|--|
| FRQ | Frequent |
| FSL | Full stop landing |
| FSS | Flight service station |
| FST | First |
| FT | Feet (dimensional unit) |
| FU | Smoke |
| FZ | Freezing |
| FZDZ | Freezing drizzle |
| FZFG | Freezing fog |
| FZL | Freezing level |
| FZRA | Freezing rain |
| G | |
| G/A | Ground-to-air |
| G/A/G | Ground-to-air and air-to-ground |
| GBAS | Ground Based Augmentation System |
| GCA | Ground control approach or ground controlled approach |
| GEN | General |
| GEO | Geographic or true |
| GLD | Glider |
| GMT | Greenwich mean time |
| GND | Ground |
| GNDCK | Ground check |
| GNSS | Global Navigation Satellite System |
| GP | Glide path |
| GPWS | Ground Proximity Warning System |
| GR | Hail |
| GRADU | Gradual or gradually |
| GRAS | Ground Based Regional Augmentation system |
| GRASS | Grass landing area |
| GRID | Processed meteorological data in the form of grid point values (in aeronautical meteorological office) |

| | |
|----------|--|
| GRVL | Gravel |
| GS | Ground seed |
| H | |
| H24 | Continuous day and night service |
| HBN | Hazard beacon |
| HDG | Heading |
| HEL | Helicopter |
| HF | High frequency (3000 to 30000 kHz) |
| HGT | Height or height above |
| HJ | Sunrise to sunset |
| HLS | Helicopter landing site |
| HLDG | Holding |
| HN | Sunset to sunrise |
| HO | Service available to meet operational requirement |
| HOL | Holiday |
| HOSP | Hospital aircraft |
| HPA | Hectopascal |
| HR | Hours |
| HS | Service available during hours of scheduled operations |
| HURCN | Hurricane(s) |
| HX | No specific working hours |
| HZ | Hertz (cycles per second) |
| HZS | Horizontal surface |
| I | |
| IAF | Initial approach fix |
| IAL | Instrument approach and landing |
| IAO | In and out of clouds |
| IAP | Instrument Approach Procedure |
| IAR | Intersection of air routes |
| IAS | Indicated air speed |

| | |
|---------|---|
| IBN | Identification beacon |
| ICAO | International Civil Aviation Organisation |
| ICE | Icing |
| IDENT | Identification |
| IAF | Intermediate approach fix |
| IFF | Identification friend/foe |
| IFR | Instrument flight rules |
| IGA | International general aviation |
| ILS | Instrument landing system |
| IM | Inner marker |
| IMC | Instrument meteorological condition |
| IMPR | Improve or improving |
| IMT | Immediate or immediately |
| INA | Initial approach |
| INBD | Inbound |
| INC | In cloud |
| INCERFA | Uncertainty phase |
| INFO | Information |
| INOP | Inoperative |
| INP | If not possible |
| INPR | In progress |
| INS | Inches (dimensional unit) |
| INS | Inertial navigation system |
| INSTL | Install or installed or installation |
| INSTR | Instrument |
| INT | Intersection |
| INTER | Intermittent |
| INTL | International |
| INTRG | Interrogator |
| INTRP | Interrupt, interrupted or interruption |
| INTSF | Intensify or intensifying |

| | |
|-------|-----------------------------------|
| INTST | Intensity |
| IR | Ice on runway |
| IRS | Inertial Reference System |
| ISA | International standard atmosphere |
| ISOL | Isolated |

J

| | |
|------|------------|
| JAN | January |
| JTST | Jet stream |
| JUL | July |
| JUN | June |

K

| | |
|-----|--------------------|
| KG | kilogram(s) |
| KHZ | Kilohertz |
| KM | Kilometer(s) |
| KMH | Kilometer per hour |
| KPA | Kilopascal |
| KT | Knots |
| KW | Kilowatt |

L

| | |
|-----|------------------------------|
| L | Left (runway identification) |
| L | Locator (see LM, LO) |
| LAN | Inland |
| LAT | Latitude |
| LB | Pounds (weight) |
| LCN | Load classification number |
| LDA | Landing distance available |
| LDG | Landing |
| LDI | Landing direction indicator |
| LEN | Length |

| | |
|----------|--|
| LF | Low frequency (30 to 300 khz) |
| LGT | Light or lighting |
| LGTD | Lighted |
| LLZ | Localizer |
| LM | Locator, middle |
| LMT | Local mean time |
| LO | Locator, outer |
| LOC | Locally, location or located |
| LONG | Longitude |
| LORAN | LORAN (long range air navigation system) |
| LR | The last message received by me was. |
| LRG | Long range |
| LS | The last message sent by me was.... |
| LSQ | Line squall |
| LTD | Limited |
| LTH | Light-intensity high |
| LTL | Light-intensity low |
| LTM | Light-intensity medium |
| LV | Light and variable (relating to wind) |
| LYR | Layer or layered |
| M | |
| M | Meter |
| M | Mach Number (Followed by figures) |
| MAG | Magnetic |
| MAINT | Maintenance |
| MAP | Aeronautical maps and charts |
| MAPT | Missed approach point |
| MAR | March |
| MAR | At sea |
| MAX | Maximum |
| MAY | May |

| | |
|-------|---|
| MB | Millibar |
| MDA | Minimum descent altitude |
| MDH | Minimum descent height |
| MEA | Minimum en-route altitude |
| METAR | Aviation routine weather report (in aeronautical meteorological code) |
| MF | Medium frequency 300 to 3000 khz |
| MHZ | Megahertz |
| MIFG | Shallow fog |
| MIL | Military |
| MIN | Minutes |
| MISC | Miscellaneous |
| MKR | Marker radio beacon |
| MNM | Minimum |
| MLS | Microwave landing system |
| MM | Middle marker |
| MNPS | Minimum Navigation Performance Specifications |
| MNPSA | Minimum Navigation Performance Specifications |
| MNT | Monitor or monitoring or monitored |
| MNTN | Maintain |
| MOC | Minimum obstacle clearance (required) |
| MOCA | Minimum obstacle clearance altitude |
| MOD | Moderate (used to qualify icing, turbulence, interference, or static reports) |
| MON | Above mountains |
| MON | Monday |
| MOV | Move or moving or movement |
| MPH | Statute miles per hour |
| MPS | Metres per second |
| MRG | Medium range |
| MRP | ATS/MET reporting points |
| MS | Minus |
| MSA | Minimum safe altitude |

| | |
|----------------------------|--|
| MSG | Message |
| MSL | Mean sea level |
| MT | Mountain |
| MTOF | Maximum Take-Off Weight |
| MTU | Metric units |
| MTW | Mountain waves |
| MWO | Meteorological watch office |
| N | |
| North or northern latitude | |
| NAV | Navigation |
| NB | North bound |
| NC | No change |
| NDB | Non-directional radio beacon |
| NE | North-east |
| NEG | Negative |
| NGT | Night |
| NIL | None or I have nothing to send |
| NM | Nautical miles |
| NML | Normal |
| NNNN | Connect to (.....) stations (used in multiple transmission, followed by call sign of stations) |
| NNE | North north east |
| NNW | North north west |
| NOF | International NOTAM Office |
| NOSIG | No significant change (used in trend type landing forecast) |
| NOTAM | A notice containing information concerning the establishment, condition, or change, in any aeronautical facility, service, procedure or hazard, the timely knowledge of which is essential to personnel concerned with flight operations |
| NOV | November |
| NPA | Non Precision Approach |

| | |
|----------|--|
| NR | Number |
| NS | Nimbostratus |
| NSC | Nil Significant Cloud |
| NW | North west |
| NXT | Next |
| O | |
| OAS | Obstacle assessment surface |
| OBS | Observe or observed or observation |
| OBSC | Obscure or obscured or obscuring |
| OBST | Obstacle |
| OBSTR | Obstruction |
| OCA | Obstacle Clearance Altitude |
| OCC | Occulting (light) |
| OCH | Obstacle Clearance Height |
| OCNL | Occasional or occasionally |
| OCS | Obstacle clearance surface |
| OCT | October |
| OK | We agree or it is correct |
| OM | Outer marker |
| OPA | Opaque, white type of ice formation |
| OPC | The control indicated is operational control |
| OPMA | Onboard Performance Monitoring and Alerting |
| OPMET | Operational meteorological (information) |
| OPN | Open or opened or opening |
| OPS | Operations |
| O/R | On request |
| ORD | Indication of an order |
| OTP | On top |
| OVC | Overcast |

P

| | |
|----------|---|
| P | Prohibited area (followed by identification) |
| PANS | Procedures for air navigation services |
| PAPI | Precision approach Path indicator |
| PAR | Precision approach radar |
| PARL | Parallel |
| PAX | Passenger(s) |
| PCN | Pavement classification number |
| PELR | Personnel Licensing Requirements |
| PER | Performance |
| PERM | Permanent |
| PJE | Parachute jumping exercise |
| PLA | Practice low approach |
| PN | Prior notice required |
| PNR | Point of no return |
| PO | Dust devils |
| POB | Person on board |
| PPI | Plan position indicator |
| PPR | Prior permission required |
| PRKG | Parking |
| PROB | Probability |
| PROC | Procedure |
| PROV | Provisional |
| PS | Plus |
| PSG | Passing |
| PSN | Position |
| PVT | Private |
| PWR | Power |
| Q | |
| QDM | Magnetic heading (zero wind) |
| QDR | Magnetic Bearing |
| QFE | Atmospheric pressure at aerodrome elevation (or runway threshold) |

| | |
|----------|--|
| QFU | Magnetic orientation of runway |
| QNH | Altimeter sub-scale setting to obtain elevation when on the ground |
| QTE | True bearing |
| QUAD | Quadrant |
| R | |
| R | Restricted area (followed by identification) |
| R | Right (followed by runway identification) |
| RA | Rain |
| RA | Resolution Advisory |
| RAC | Rules of the air and Air Traffic Services |
| RAD | Radius |
| RAG | Ragged |
| RAI | Runway alignment indicator |
| RAPID | Rapid or rapidity |
| RASH | Rain and showers |
| RB | Read back |
| RB | Rescue boat |
| RCC | Rescue co-ordination centre |
| RCF | Radio communication failure (message type designator) |
| RCL | Runway centre line |
| RCP | Required Communication Performance |
| RDO | Radio |
| RDL | Radial |
| RE | Recent (used to qualify weather phenomena such as rain),e.g. recent rain |
| = RERA | |
| REC | Receive or receiver |
| REF | Reference to .. or refer to |
| REG | Registration |
| REILS | Runway end illumination light system |
| REP | Report or reporting or reporting point |
| REQ | Request or requested |

| | |
|--------|--|
| RG | Range (lights) |
| RIF | Reclearance in flight |
| RITE | Right (direction or turn) |
| RLCE | Request level change en-route) |
| RMK | Remark |
| RNAV | Area navigation |
| RNG | Radio range |
| RNP | Required Navigation Performance |
| ROBEX | Regional OPMET bulletin exchange (exchange) |
| ROC | Rate of climb |

CHAPTER 2

ATS SAFETY MANAGEMENT

2.1 GENERAL

2.1.1 ANSP shall ensure that the level of air traffic services (ATS) and communications, navigation and surveillance, as well as the ATS procedures applicable to the airspace or aerodrome concerned within Kathmandu FIR, are appropriate and adequate for maintaining an acceptable level of safety in the provision of ATS.

2.1.2 The requirements in respect of services, system and procedures applicable to airspaces and aerodromes should be established on the basis of securing the highest practicable degree of uniformity in procedures in adjacent airspaces.

2.1.3 To ensure that safety in provision of ATS is maintained, the ANSP shall implement a safety management system acceptable to Civil Aviation Safety Regulation Directorate that, as a minimum:

- a. identifies safety hazards;
- b. ensure the implementation of remedial action necessary to maintain agreed safety performance;
- c. provides for continuous monitoring and regular assessment of the safety performance; and
- d. aims at a continuous improvement of overall performance of safety management system.

2.1.4 A safety management system shall clearly define lines of safety accountability throughout air traffic services provider, including a direct accountability for safety on the part of senior management.

2.2 OBJECTIVES

The objectives of ATS safety management are to ensure that:

- a. the established level of safety applicable to the provision of ATS within an airspace or at an aerodrome is met; and
- b. safety-related enhancements are implemented whenever necessary.

2.3 ATS SAFETY MANAGEMENT ACTIVITIES

2.3.1 An ATS SMS will include the following with respect to the provision of air traffic services:

- a. monitoring of overall safety levels and detection of any adverse trend;
- b. safety reviews of ATS units;
- c. safety assessments in respect of the planned implementation of airspace reorganizations, the introduction of new equipment systems or facilities, and new or changed ATS procedures; and
- d. a mechanism for identifying the need for safety enhancing measures.

2.3.2 All activities undertaken in an ATS SMS shall be fully documented. All documentation shall be kept for a minimum of 3 years.

2.4 MONITORING OF SAFETY LEVELS

2.4.1 Collection and evaluation of safety-related data

2.4.1.1 Data for use in safety monitoring programmes should be collected from as wide range of sources as possible, as a safety-related consequences of particular procedures or system may not be realized until after an incident has occurred.

2.4.1.2 The ANSP should establish a formal incident reporting system for ATS personnel to facilitate the collection of information on actual or potential safety hazards or deficiencies related to the provision of ATS, including route structures, procedures, communications, navigation and surveillance systems and other safety significant systems and equipment as well as controller workloads.

Note-Guidance related to both mandatory and voluntary incident reporting systems is contained in the Safety Management Manual (SMM) (Doc9859)

2.4.2 Review of incident and other safety-related reports

2.4.2.1 Safety-related reports concerning the operation of air traffic services, including air traffic incident reports, shall be systematically reviewed by the ANSP to detect any adverse trend in the number and type of incident which occur.

- 2.4.2.2 Reports concerning the serviceability of ATS facilities and system, such as failures and degradations of communications, surveillance and other safety significant systems and equipment, shall be systematically reviewed by the ANSP to detect any trend in the operation of such systems which may have an adverse effect on safety.

2.5 SAFETY REVIEWS

2.5.1 General requirements

Safety reviews of ATS units shall be conducted on a regular and systematic basis by personnel qualified through training, experience and expertise and having a full understanding of relevant civil aviation requirements (CARs), Procedures for Air Navigation Services (PANS), safe operating practices and Human Factors principles.

2.5.2 Scope

The scope of ATS unit safety reviews should include at least the following issues:

2.5.2.1 Regulatory issues to ensure that:

- a. ATS operations manuals, ATS unit instructions and air traffic control (ATC) coordination procedures are complete, concise and up-to-date;
- b. the ATS route structure, where applicable, provides for:
 - i. adequate route spacing; and
 - ii. crossing points for ATS routes located so as to reduce the need for controller intervention and for inter- and intra-unit coordination;
- c. the separation minima used in the airspace or at the aerodrome are appropriate and all the provisions applicable to those minima are being complied with;
- d. where applicable, provision is made for adequate observation of the manoeuvring area, and procedures and measures aimed at minimizing the potential for inadvertent runway incursions are in place. This observation may be performed visually or by means of an ATS surveillance system; runway safety program shall be developed and implemented by aerodrome operators for minimizing the potential for inadvertent runway incursion;
- e. appropriate procedures for low visibility aerodrome operations are in place;

- f. traffic volumes and associated controller workloads do not exceed defined, safe levels and that procedures are in place for regulating traffic volumes whenever necessary;
- g. procedures to be applied in the event of failures or degradations of ATS systems, including communications, navigation and surveillance systems, are practicable and will provide for an acceptable level of safety; and
- h. procedures for the reporting of incidents and other safety-related occurrences are implemented, that the reporting of incidents is encouraged and that such reports are reviewed to identify the need for any remedial action.

2.5.2.2 Operational and technical issues to ensure that:

- a. the environmental working conditions meet established levels for temperature, humidity, ventilation, noise and ambient lighting, and do not adversely affect controller performance;
- b. automation systems generate and display flight plan, control and coordination data in a timely, accurate and easily recognizable manner and in accordance with Human Factors principles;
- c. equipment, including input/output devices for automation systems, are designed and positioned in the working position in accordance with ergonomic principles;
- d. communications, navigation, surveillance and other safety significant systems and equipment:
 - i. are tested for normal operations on a routine basis;
 - ii. meet the required level of reliability and availability as defined by the ANSP and accepted by Civil Aviation Safety Regulation Directorate;
 - iii. provide for the timely and appropriate detection and warning of system failures and degradations;
 - iv. include documentation on the consequences of system, subsystem and equipment failures and degradations;
 - v. include measures to control the probability of failures and degradations; and
 - vi. include adequate backup facilities and/or procedures in the event of a system failure or degradation; and
- e. detailed records of systems and equipment serviceability are kept and periodically reviewed.

Note- In the context above, the terms reliability and availability have the following meanings:

- 1. Reliability. The probability that a device or system will function without failure over a specified time period or amount of usage; and*
- 2. Availability. The ratio of percentage of the time that a system is operating correctly to the total time in that period.*

2.5.2.3 Licensing and training issues to ensure that:

- a. controllers are adequately trained and properly licensed with valid ratings;
- b. controller competency is maintained by adequate and appropriate refresher training, including the handling of aircraft emergencies and operations under conditions with failed and degraded facilities and systems;
- c. controllers, where the ATC unit/control sector is staffed by teams, are provided relevant and adequate training in order to ensure efficient teamwork;
- d. the implementation of new or amended procedures, and new or updated communications, surveillance and other safety significant systems and equipment is preceded by appropriate training and instruction;
- e. controller competency in the English language is satisfactory in relation to providing ATS to international air traffic as well as domestic traffic; and
- f. standard phraseology is used.

2.6 SAFETY RISK ASSESSMENTS

2.6.1 Need for safety risk assessments:

2.6.1.1 A safety risk assessment shall be carried out in respect of proposals for significant airspace reorganizations, for significant changes in the provision of ATS procedures applicable to an airspace or an aerodrome, and for the introduction of new equipment, systems or facilities, such as:

- a. a reduced separation minimum to be applied within an airspace or at an aerodrome;
- b. a new operating procedure, including departure and arrival procedures, to be applied

- within an airspace or at an aerodrome;
- c. a reorganization of the ATS route structure;
- d. a resectorization of an airspace;
- e. physical changes to the layout of runways and/or taxiways at an aerodrome; and
- f. implementation of new communications, surveillance or other safety-significant systems and equipment, including those providing new functionality and/or capabilities.

Note 1.— A reduced separation minimum may refer to the reduction of a horizontal separation minimum, including a minimum based on required navigation performance (RNP), a reduced vertical separation minimum of 300 m (1 000 ft) between FL 290 and FL 410 inclusive (RVSM), the reduction of a separation minimum based on the use of an ATS surveillance system or a wake turbulence separation minimum or reduction of minima between landing and/or departing aircraft.

Note 2.— When, due to the nature of the change, the acceptable level of safety cannot be expressed in quantitative terms, the safety risk assessments may rely on operational judgement.

2.6.1.2 Proposals shall be implemented only when the assessment has shown that an acceptable level of safety will be met.

2.6.2 Safety-significant factors

The safety risk assessment shall consider relevant all factors determined to be safety-significant, including:

- a. types of aircraft and their performance characteristics, including aircraft navigation capabilities and navigation performance;
- b. traffic density and distribution;
- c. airspace complexity, ATS route structure and classification of the airspace;
- d. aerodrome layout, including runway configurations, runway lengths and taxiway configurations;
- e. type of air-ground communications and time parameters for communication dialogues, including controller intervention capability;
- f. type and capabilities of surveillance system, and the availability of systems providing

controller support and alert functions. Where ADS-B implementation envisages reliance upon a common source for surveillance and/or navigation, the safety risk assessment shall take account of adequate contingency measures to mitigate the risk of either degradation or loss of this common source (i.e. common mode failure); and

- g. type and capabilities of surveillance system, and the availability of systems providing controller support and alert functions.
- h. any significant local or regional weather phenomena.

Note 1.— See also Chapter 5, Section 5.11, concerning reductions in separation minima.

Note 2.— Guidance material on methods of expressing and assessing a safety level and on safety monitoring programmes is contained in Annex 11, Attachment B, the Air Traffic Services Planning Manual (Doc 9426), the Manual on a 300 m (1 000 ft) Vertical Separation Minimum Between FL 290 and FL 410 Inclusive (Doc 9574), the Performance-based Navigation (PBN) Manual (Doc 9613) and the Manual on Airspace Planning Methodology for the Determination of Separation Minima (Doc 9689).

2.7 SAFETY-ENHANCING MEASURES

- 2.7.1** Any actual or potential hazard related to the provision of ATS within an airspace or at an aerodrome, whether identified through an ATS safety management activity or by any other means, shall be assessed and classified by the ANSP for its risk acceptability.
- 2.7.2** Except when the risk can be classified as acceptable, the ANSP shall as a matter of priority and as far as practicable, implement appropriate measures to eliminate the risk or reduce the risk to a level that is acceptable.
- 2.7.3** If it becomes apparent that the level of safety applicable to an airspace or an aerodrome is not, or may not be achieved, the ANSP shall, as a matter of priority and as far as practicable, implement appropriate remedial measures.
- 2.7.4** Implementation of any remedial measure shall be followed by an evaluation of the effectiveness of the measure in eliminating or mitigating a risk.

CHAPTER 3

ATS SYSTEM CAPACITY AND AIR TRAFFIC FLOW MANAGEMENT

3.1 CAPACITY MANAGEMENT

- 3.1.1.1 ANSP shall ensure that the level of air traffic services (ATS) and communications, navigation and surveillance, as well as the ATS procedures applicable to the airspace or aerodrome concerned within Kathmandu FIR, are appropriate and adequate for maintaining an acceptable level of safety in the provision of ATS.
- 3.1.1.2 The capacity of an ATS system depends on many factors, including the ATS route structure, the navigation accuracy of the aircraft using the airspace, weather-related factors, and controller workload. Every effort should be made to provide sufficient capacity to cater to both normal and peak traffic levels; however, in implementing any measures to increase capacity, the responsible ANSP shall ensure, in accordance with the procedures specified in Chapter 2, that safety levels are not jeopardized.
- 3.1.1.3 The number of aircraft provided with an ATC service shall not exceed that which can be safely handled by the ATC unit concerned under the prevailing circumstances. In order to define the maximum number of flights which can be safely accommodated, the appropriate ANSP should assess and declare the ATC capacity for control areas, for control sectors within a control area and for aerodromes.
- 3.1.1.4 ATC capacity should be expressed as the maximum number of aircraft which can be accepted over a given period of time within the airspace or at the aerodrome concerned.

Note.— The most appropriate measure of capacity is likely to be the sustainable hourly traffic flow. Such hourly capacities can, for example, be converted into daily, monthly or annual values.

3.1.2 Capacity assessment

In assessing capacity values, factors to be taken into account should include, inter alia:

- a. the level and type of ATS provided;
- b. the structural complexity of the control area, the control sector or the aerodrome concerned;

- c. controller workload, including control and coordination tasks to be performed;
- d. the types of communications, navigation and surveillance systems in use, their degree of technical reliability and availability as well as the availability of backup systems and/or procedures;
- e. availability of ATC systems providing controller support and alert functions; and
- f. any other factor or element deemed relevant to controller workload.

Note.— Summaries of techniques which may be used to estimate control sector/position capacities are contained in the Air Traffic Services Planning Manual (Doc9426).

3.1.3 Regulation of ATC capacity and traffic volumes

- 3.1.3.1 Where traffic demand varies significantly on a daily or periodic basis, facilities and procedures should be implemented to vary the number of operational sectors or working positions to meet the prevailing and anticipated demand. Applicable procedures should be contained in local instructions.
- 3.1.3.2 In case of particular events which have a negative impact on the declared capacity of an airspace or aerodrome, the capacity of the airspace or aerodrome concerned shall be reduced accordingly for the required time period. Whenever possible, the capacity pertaining to such events should be predetermined.
- 3.1.3.3 To ensure that safety is not compromised whenever the traffic demand in an airspace or at an aerodrome is forecast to exceed the available ATC capacity, measures shall be implemented to regulate traffic volumes accordingly.

3.1.4 Enhancement of ATC capacity

- 3.1.4.1 The ANSP should:
 - a. periodically review ATS capacities in relation to traffic demand; and
 - b. provide for flexible use of airspace in order to improve the efficiency of operations and increase capacity.
- 3.1.4.2 In the event that traffic demand regularly exceeds ATC capacity, resulting in continuing and frequent traffic delays, or it becomes apparent that forecast traffic demand will

exceed capacity values, the ANSP should, as far as practicable:

- a. implement steps aimed at maximizing the use of the existing system capacity; and
- b. develop plans to increase capacity to meet the actual or forecast demand.

3.1.5 Flexible use of airspace

3.1.5.1 The appropriate authorities should, through the establishment of agreements and procedures, make provision for the flexible use of all airspace in order to increase airspace capacity and to improve the efficiency and flexibility of aircraft operations.

3.1.5.2 Agreements and procedures providing for a flexible use of airspace should specify, inter alia:

- a. the horizontal and vertical limits of the airspace concerned;
- b. the classification of any airspace made available for use by civil air traffic;
- c. units or authorities responsible for transfer of the airspace;
- d. conditions for transfer of the airspace to the ATC unit concerned;
- e. conditions for transfer of the airspace from the ATC unit concerned;
- f. periods of availability of the airspace;
- g. any limitations on the use of the airspace concerned; and
- h. any other relevant procedures or information.

3.2 AIR TRAFFIC FLOW MANAGEMENT

3.2.1 General

3.2.1.1 An air traffic flow management (ATFM) service shall be implemented for airspace where traffic demand at times exceeds the defined ATC capacity.

3.2.1.2 Certain flights may be exempt from ATFM measures, or be given priority over other flights.

3.2.2 Flow management procedures ATFM should be carried out in three phases:

- a. strategic planning, if the action is carried out more than one day before the day on which it will

take effect. Strategic planning is normally carried out well in advance, typically two to six months ahead;

- b. pre-tactical planning, if the action is to be taken on the day before the day on which it will take effect;
- c. tactical operations, if the action is taken on the day on which it will take effect.

3.2.3 Strategic planning

3.2.3.1 Strategic planning should be carried out in conjunction with ATC and the aircraft operators. It should consist of examining the demand for the forthcoming season, assessing where and when demand is likely to exceed the available ATC capacity and taking steps to resolve the imbalance by:

- a. arranging with the ANSP to provide adequate capacity at the required place and time;
- b. re-routing certain traffic flows (traffic orientation);
- c. scheduling or rescheduling flights as appropriate; and
- d. identifying the need for tactical ATFM measures

3.2.3.2 Where a traffic orientation scheme (TOS) is to be introduced, the routes should, as far as practicable, minimize the time and distance penalties for the flights concerned, and allow some degree of flexibility in the choice of routes, particularly for long-range flights.

3.2.3.3 When a TOS has been agreed, details should be published by the ANSP concerned in a common format.

3.2.4 Pre-tactical planning

Pre-tactical planning should entail fine-tuning of the strategic plan in the light of updated demand data. During this phase:

- a. certain traffic flows may be re-routed;
- b. off-load routes may be coordinated;
- c. tactical measures will be decided upon; and
- d. details for the ATFM plan for the following day should be published and made available to

all concerned.

3.2.5 Tactical operations

3.2.5.1 Tactical ATFM operations should consist of:

- a. executing the agreed tactical measures in order to provide a reduced and even flow of traffic where demand would otherwise have exceeded capacity;
- b. monitoring the evolution of the air traffic situation to ensure that the ATFM measures applied are having the desired effect and to take or initiate remedial action when long delays are reported, including re-routing of traffic and flight level allocation, in order to utilize the available ATC capacity to the maximum extent.

3.2.5.2 When the traffic demand exceeds, or is foreseen to exceed, the capacity of a particular sector or aerodrome, the responsible ATC unit shall advise the responsible ATFM unit, where such a unit is established, and other ATC units concerned. Flight crews of aircraft planned to fly in the affected area and operators should be advised, as soon as practicable, of the delays expected or the restrictions which will be applied.

Note.— Operators known or believed to be concerned will normally be advised by the regional air traffic flow management service, when established.

3.2.6 Liaison

During all phases of ATFM the responsible units should liaise closely with ATC and the aircraft operators in order to ensure an effective and equitable service.

Note.— Attention is drawn to the guidance material contained in the Air Traffic Services Planning Manual (Doc 9426) regarding flow control as well as to procedures contained in the Regional Supplementary Procedures (Doc 7030) and regional ATFM Handbooks.

CHAPTER 4

GENERAL PROVISIONS FOR AIR TRAFFIC SERVICES

4.1 RESPONSIBILITY FOR THE PROVISION OF AIR TRAFFIC CONTROL SERVICE

4.1.1 Area control service

Area control service shall be provided:

- a. by an area control centre (ACC); or
- b. by the unit providing approach control service in a control zone or in a control area of limited extent which is designated primarily for the provision of approach control service, when no ACC is established.

4.1.2 Approach control service

Approach control service shall be provided:

- a. by an aerodrome control tower or an ACC, when it is necessary or desirable to combine under the responsibility of one unit the functions of the approach control service and those of the aerodrome control service or the area control service; or
- b. by an approach control unit, when it is necessary or desirable to establish a separate unit.

Note.— Approach control service may be provided by a unit collocated with an ACC, or by a control sector within an ACC.

4.1.3 Aerodrome control service

Aerodrome control service shall be provided by an aerodrome control tower.

4.2 RESPONSIBILITY FOR THE PROVISION OF FLIGHT INFORMATION SERVICE AND ALERTING SERVICE

Flight information service and alerting service shall be provided as follows:

4.2.1 within a flight information region (FIR): by a flight information centre, unless the responsibility for providing such services is assigned to an air traffic control unit having adequate facilities for the exercise of such responsibilities;

4.2.2 within controlled airspace and at controlled aerodromes: by the relevant air traffic control units.

4.3 DIVISION OF RESPONSIBILITY FOR CONTROL BETWEEN AIR TRAFFIC CONTROL UNITS

4.3.1 General

The ANSP must designate the area of responsibility for each air traffic control (ATC) unit and, when applicable, for individual control sectors within an ATC unit. Where there is more than one ATC working position within a unit or sector, the duties and responsibilities of the individual working positions shall be defined.

4.3.2 Between a unit providing aerodrome control service and a unit providing approach control service

4.3.2.1 Except for flights which are provided aerodrome control service only, the control of arriving and departing controlled flights shall be divided between units providing aerodrome control service and units providing approach control service as follows:

4.3.2.1.1 Arriving aircraft. Control of an arriving aircraft shall be transferred from the unit providing approach control service to the unit providing aerodrome control service when the aircraft:

- a. is in the vicinity of the aerodrome, and
 - 1. it is considered that approach and landing will be completed in visual reference to the ground, or
 - 2. has reached uninterrupted visual meteorological conditions, or
- b. is at a prescribed point or level, or

- c. has landed, as specified in letters of agreement or ATS unit instructions.

4.3.2.1.2 Transfer of communications to the aerodrome controller should be effected at such a point, level or time that clearance to land or alternative instructions, as well as information on essential local traffic, can be issued in a timely manner.

Note.— Even though there is an approach control unit, control of certain flights may be transferred directly from an ACC to an aerodrome control tower and vice versa, by prior arrangement between the units concerned for the relevant part of approach control service to be provided by the ACC or the aerodrome control tower, as applicable.

4.3.2.1.3 Departing aircraft. Control of a departing aircraft shall be transferred from the unit providing aerodrome control service to the unit providing approach control service:

- a. when visual meteorological conditions prevail in the vicinity of the aerodrome:
 - 1. prior to the time the aircraft leaves the vicinity of the aerodrome,
 - 2. prior to the aircraft entering instrument meteorological conditions, or
 - 3. when the aircraft is at a prescribed point or level, as specified in letters of agreement or ATS unit instructions;
- b. when instrument meteorological conditions prevail at the aerodrome:
 - 1. immediately after the aircraft is airborne, or
 - 2. when the aircraft is at a prescribed point or level, as specified in letters of agreement or local instructions.

Note.— See Note following 4.3.2.1.2.

4.3.3 Between a unit providing approach control service and a unit providing area control service

4.3.3.1 When area control service and approach control service are not provided by the same air traffic control unit, responsibility for controlled flights shall rest with the unit

providing area control service except that a unit providing approach control service shall be responsible for the control of:

- a. arriving aircraft that have been released to it by the ACC;
- b. departing aircraft until such aircraft are released to the ACC.

4.3.3.2 A unit providing approach control service shall assume control of arriving aircraft, provided such aircraft have been released to it, upon arrival of the aircraft at the point, level or time agreed for transfer of control, and shall maintain control during approach to the aerodrome.

4.3.4 Between two units providing area control service

The responsibility for the control of an aircraft shall be transferred from a unit providing area control service in a control area to the unit providing area control service in an adjacent control area at the time of crossing the common control area boundary as estimated by the ACC having control of the aircraft or at such other point, level or time as has been agreed between the two units.

4.3.5 Between control sectors/positions within the same air traffic control unit

The responsibility for the control of an aircraft shall be transferred from one control sector/position to another control sector/position within the same ATC unit at a point, level or time, as specified in local instructions.

4.4 FLIGHT PLAN

4.4.1 Flight Plan Form

Note.— Procedures for the use of repetitive flight plans are contained in Chapter 16, Section 16.4.

4.4.1.1 A flight plan form based on the model in Appendix 2 should be provided and should be used by operators and air traffic services units for the purpose of completing flight plans.

Note.— A different form may be provided for use in completing repetitive flight plan listings.

4.4.1.2 The flight plan form should be printed in English

4.4.1.3 Operators and air traffic services units should comply with the instructions for completion of the flight plan form and the repetitive flight plan listing form given in Appendix 2.

4.4.1.4 An operator shall, prior to departure:

- a. ensure that, where the flight is intended to operate on a route or in an area where a navigation specification is prescribed, it has an appropriate RNP approval, and that all conditions applying to that approval will be satisfied;
- b. ensure that, where operation in reduced vertical separation minimum (RVSM) airspace is planned, has the required RVSM approval; and
- c. ensure that, where the flight is intended to operate where an RCP specification is prescribed, it has an appropriate approval, and that all conditions applying to that approval will be satisfied: and
- d. ensure that, where the flight is intended to operate where an RSP specification is prescribed, it has an appropriate RSP approval, and that all conditions applying to that approval will be satisfied.

4.4.2 Submission of a flight plan

4.4.2.1 Information relative to an intended flight or portion of a flight, to be provided to air traffic services unit, shall be in the form of a flight plan.

4.4.2.2 A flight plan shall be submitted prior to operating:

- a. any flight or portion thereof to be provided with air traffic control service;
- b. any flight within or into designated areas, or along designated routes to facilitate the provision of flight information, alerting and search and rescue services ;
- c. any flight within or into designated areas, or along designated routes to facilitate co-ordination with appropriate military units or with air traffic services units in adjacent states in order to avoid the possible need for interception for the purpose of identification;
- d. any flight across international borders.

4.4.2.3 Prior to Departure

4.4.2.3.1 Except when other arrangements have been made for submission of repetitive flight plans, a flight plan submitted prior to departure should be submitted to the air traffic services reporting office at the departure aerodrome. If no such unit exists at the departure aerodrome, the flight plan should be submitted to the unit serving or designated to serve the departure aerodrome. A flight plan for a flight to be provided with air traffic control service shall be submitted at least sixty minutes before departure.

4.4.2.3.2 In the event of a delay of 30 minutes for international flights and 60 minutes for domestic flights in excess of the estimated off-block time, the flight plan should be amended or a new flight plan submitted and the old flight plan cancelled, whichever is applicable.

4.4.2.4 During Flight

A flight plan to be submitted during flight should normally be transmitted to the ATS unit in charge of the FIR, control area in or on which the aircraft is flying, or in or through which the aircraft wishes to fly or to the aeronautical telecommunication station serving the air traffic services unit concerned. When this is not practicable, it should be transmitted to another ATS unit or aeronautical telecommunication station for retransmission as required to the appropriate air traffic services unit.

4.4.3 Acceptance of a flight plan

The first ATS unit receiving a flight plan, or change thereto, shall:

- a. check it for compliance with the format and data conventions;
- b. check it for completeness and, to the extent possible, for accuracy;
- c. take action, if necessary, to make it acceptable to the air traffic services; and
- d. indicate acceptance of the flight plan or change thereto, to the originator.

4.5 AIR TRAFFIC CONTROL CLEARANCES

4.5.1 Scope and purpose

- 4.5.1.1 Clearances are issued solely for expediting and separating air traffic and are based on known traffic conditions which affect safety in aircraft operation. Such traffic conditions include not only aircraft in the air and on the manoeuvring area over which control is being exercised, but also any vehicular traffic or other obstructions not permanently installed on the manoeuvring area in use.
- 4.5.1.2 If an air traffic control clearance is not suitable to the pilot-in-command of an aircraft, the flight crew may request and, if practicable, obtain an amended clearance.
- 4.5.1.3 The issuance of air traffic control clearances by air traffic control units constitutes authority for an aircraft to proceed only in so far as known air traffic is concerned. ATC clearances do not constitute authority to violate any applicable regulations for promoting the safety of flight operations or for any other purpose; neither do clearances relieve a pilot-in-command of any responsibility whatsoever in connection with a possible violation of applicable rules and regulations.
- 4.5.1.4 ATC units shall issue such ATC clearances as are necessary to prevent collisions and to expedite and maintain an orderly flow of air traffic.
- 4.5.1.5 ATC clearances must be issued early enough to ensure that they are transmitted to the aircraft in sufficient time for it to comply with them.

4.5.2 Aircraft subject to ATC for part of flight

- 4.5.2.1 When a flight plan specifies that the initial portion of a flight will be uncontrolled, and that the subsequent portion of the flight will be subject to ATC, the aircraft shall be advised to obtain its clearance from the ATC unit in whose area controlled flight will be commenced.
- 4.5.2.2 When a flight plan specifies that the first portion of a flight will be subject to ATC, and that the subsequent portion will be uncontrolled, the aircraft shall normally be cleared to the point at which the controlled flight terminates.

4.5.3 Flights through intermediate stops

- 4.5.3.1 When an aircraft files, at the departure aerodrome, flight plans for the various stages of flight through intermediate stops, the initial clearance limit will be the first destination aerodrome and new clearances shall be issued for each subsequent portion of flight.
- 4.5.3.2 The flight plan for the second stage, and each subsequent stage, of a flight through intermediate stops will become active for ATS and search and rescue (SAR) purposes only when the appropriate ATS unit has received notification that the aircraft has departed from the relevant departure aerodrome, except as provided for in 4.5.3.3.
- 4.5.3.3 By prior arrangement between ATC units and the operators, aircraft operating on an established schedule may, if the proposed route of flight is through more than one control area, be cleared through intermediate stops within other control areas but only after coordination between the ACCs concerned.

4.5.4 Contents of clearances

- 4.5.4.1 Clearances shall contain positive and concise data and shall, as far as practicable, be phrased in a standard manner.
- 4.5.4.2 Clearances shall, except as provided for in Chapter 6, Section 6.3.2, concerning standard departure clearances, contain the items specified in Chapter 11, 11.4.2.5.2.1.

4.5.5 Departing aircraft

ACCs shall, except where procedures providing for the use of standard departure clearances have been implemented, forward a clearance to approach control units or aerodrome control towers with the least possible delay after receipt of request made by these units, or prior to such request if practicable.

4.5.6 En-route aircraft

- 4.5.6.1 General

4.5.6.1.1 An ATC unit may request an adjacent ATC unit to clear aircraft to a specified point during a specified period.

4.5.6.1.2 After the initial clearance has been issued to an aircraft at the point of departure, it will be the responsibility of the appropriate ATC unit to issue an amended clearance whenever necessary and to issue traffic information, if required.

4.5.7 Description of air traffic control clearances

4.5.7.1 Clearance Limit

4.5.7.1.1 A clearance limit shall be described by specifying the name of the appropriate significant point, or aerodrome, or controlled airspace boundary.

4.5.7.1.2 When prior coordination has been effected with units under whose control the aircraft will subsequently come, or if there is reasonable assurance that it can be effected a reasonable time prior to their assumption of control, the clearance limit shall be the destination aerodrome or, if not practicable, an appropriate intermediate point, and coordination shall be expedited so that a clearance to the destination aerodrome may be issued as soon as possible.

4.5.7.1.3 If an aircraft has been cleared to an intermediate point in adjacent controlled airspace, the appropriate ATC unit will then be responsible for issuing, as soon as practicable, an amended clearance to the destination aerodrome.

4.5.7.1.4 When the destination aerodrome is outside controlled airspace, the ATC unit responsible for the last controlled airspace through which an aircraft will pass shall issue the appropriate clearance for flight to the limit of that controlled airspace.

4.5.7.2 Route of Flight

4.5.7.2.1 The route of flight shall be detailed in each clearance when deemed necessary. The phrase “cleared via flight planned route” may be used to describe any route or portion thereof, provided the route or portion thereof is identical to that filed in the flight plan and sufficient routing details are given to definitely establish the aircraft on its route. The phrases “cleared via (designation) departure” or “cleared via (designation) arrival” may be used when standard departure or arrival routes have been established and published in Aeronautical Information Publications (AIPs) Nepal.

Note – See 6.3.2.3 pertaining to standard clearances for departing aircraft and 6.5.2.3 pertaining to standard clearances for arriving aircraft.

4.5.7.2.2 The phrase “cleared via flight planned route” shall not be used when granting a re-clearance.

4.5.7.2.3 Subject to airspace constraints, ATC workload and traffic density, and provided coordination can be effected in a timely manner, an aircraft should whenever possible be offered the most direct routing.

4.5.7.3 Levels

Except as provided for in Chapter 6, 6.3.2 and 6.5.1.5, use of standard departure and arrival clearances, instructions included in clearances relating to levels shall consist of the items specified in Chapter 11, 11.4.2.5.2.2.

4.5.7.4 Clearance of a Requested Change in Flight Plan

4.5.7.4.1 When issuing a clearance covering a requested change in route or level, the exact nature of the change shall be included in the clearance.

4.5.7.4.2 When traffic conditions will not permit clearance of a requested change, the word “UNABLE” shall be used. When warranted by circumstances, an alternative route or level should be offered.

4.5.7.4.3 When an alternative route is offered and accepted by the flight crew under the procedures described in 4.5.7.4.2, the amended clearance issued shall describe the route to the point where it joins the previously cleared route, or, if the aircraft will not re-join the previous route, to the destination.

4.5.7.5 Readback of Clearances

4.5.7.5.1 The flight crew shall read back to the air traffic controller safety-related parts of ATC clearances and instructions which are transmitted by voice. The following items shall always be read back:

- a. ATC route clearances;
- b. clearances and instructions to enter, land on, take off from, hold short of, cross, taxi and backtrack on any runway; and
- c. runway-in-use, altimeter settings, SSR codes, level instructions, heading and speed instructions and, whether issued by the controller or contained in automatic terminal information service (ATIS) broadcasts, transition levels.

Note.— If the level of an aircraft is reported in relation to standard pressure 1 013.2 hPa, the words “FLIGHT LEVEL” precede the level figures. If the level of the aircraft is reported in relation to QNH/QFE, the figures are followed by the word “FEET”, .

4.5.7.5.1.1 Other clearances or instructions, including conditional clearances, shall be read back or acknowledged in a manner to clearly indicate that they have been understood and will be complied with.

4.5.7.5.2 The controller shall listen to the readback to ascertain that the clearance or instruction has been correctly acknowledged by the flight crew and shall take immediate action to correct any discrepancies revealed by the readback.

4.6 HORIZONTAL SPEED CONTROL INSTRUCTIONS

4.6.1 General

- 4.6.1.1 In order to facilitate a safe and orderly flow of traffic, aircraft may be instructed to adjust speed in a specified manner. Flight crews should be given adequate notice of planned speed control.

Note 1.— Application of speed control over a long period of time may affect aircraft fuel reserves.

- 4.6.1.2 Speed control instructions shall remain in effect unless explicitly cancelled or amended by the controller.

Note – Cancellation of any speed control instruction does not relieve the flight crew of compliance with speed limitations associated with airspace classification as specified in Annex 11- Air Traffic Services, Appendix 4.

- 4.6.1.3 Speed control shall not be applied to aircraft entering or established in a holding pattern.

- 4.6.1.4 Speed adjustments should be limited to those necessary to establish and/or maintain a desired separation minimum or spacing. Instructions involving frequent changes of speed, including alternate speed increases and decreases, should be avoided.

- 4.6.1.5 The flight crew shall inform the ATC unit concerned if at any time they are unable to comply with a speed instruction. In such cases, the controller shall apply an alternative method to achieve the desired spacing between the aircraft concerned.

- 4.6.1.6 At levels at or above 7 600 m (FL 250), speed adjustments should be expressed in multiples of 0.01 Mach; at levels below 7 600 m (FL 250), speed adjustments should be expressed in multiples of 20 km/h (10 kt) based on indicated airspeed (IAS).

Note 1.— Mach 0.01 equals approximately 11 km/h (6 kt) IAS at higher flight levels.

Note 2.— When an aircraft is heavily loaded and at a high level, its ability to change speed may, in cases, be very limited.

- 4.6.1.7 Aircraft shall be advised when a speed control restriction is no longer required.

4.6.2 Methods of application

4.6.2.1 In order to establish a desired spacing between two or more successive aircraft, the controller should first either reduce the speed of the last aircraft, or increase the speed of the lead aircraft, then adjust the speed(s) of the other aircraft in order.

4.6.2.2 In order to maintain a desired spacing using speed control techniques, specific speeds need to be assigned to all the aircraft concerned.

Note 1.— The true airspeed (TAS) of an aircraft will decrease during descent when maintaining a constant IAS. When two descending aircraft maintain the same IAS, and the leading aircraft is at the lower level, the TAS of the leading aircraft will be lower than that of the following aircraft. The distance between the two aircraft will thus be reduced, unless a sufficient speed differential is applied. For the purpose of calculating a desired speed differential between two succeeding aircraft, 6 kt IAS per 1 000 ft height difference may be used as a general rule. At levels below 8000 ft the difference between IAS and TAS is negligible for speed control purposes.

Note 2.— Time and distance required to achieve a desired spacing will increase with higher levels, higher speeds, and when the aircraft is in a clean configuration.

4.6.3 Descending and arriving aircraft

4.6.3.1 An aircraft should, when practicable, be authorized to absorb a period of notified terminal delay by cruising at a reduced speed for the latter portion of its flight.

4.6.3.2 An arriving aircraft may be instructed to maintain its “maximum speed”, “minimum clean speed”, “minimum speed”, or a specified speed.

Note.— “Minimum clean speed” signifies the minimum speed at which an aircraft can be flown in a clean configuration, i.e. without deployment of lift-augmentation devices, speed brakes or landing gear.

4.6.3.3 Speed reductions to less than 250 kt IAS for turbojet aircraft during initial descent from cruising level should be applied only with the concurrence of the flight crew.

4.6.3.4 Instructions for an aircraft to simultaneously maintain a high rate of descent and reduce its speed should be avoided as such manoeuvres are normally not compatible.

Any significant speed reduction during descent may require the aircraft to temporarily level off to reduce speed before continuing descent.

4.6.3.5 Arriving aircraft should be permitted to operate in a clean configuration for as long as possible. Below FL 150, speed reductions for turbojet aircraft to not less than 220 kt IAS, which will normally be very close to the minimum speed of turbojet aircraft in a clean configuration, may be used.

4.6.3.6 Only minor speed adjustments not exceeding plus/minus 20 kt IAS should be used for aircraft on intermediate and final approach.

4.6.3.7 Speed control should not be applied to aircraft after passing a point 4 NM from the threshold on final approach.

Note.— The flight crew has a requirement to fly a stabilized approach (airspeed and configuration) typically by 3 NM from the threshold .

4.6.4 SID and STAR

The flight crew shall comply with published SID and STAR speed restrictions unless the restrictions are explicitly Cancelled or amended by the controller.

Note1 .— Some SID and STAR speed restrictions ensure containment with departure or arrival procedure (e.g. Maximum speed associated with a constant radius are to a fix (RF) leg).

Note 2.— See 6.3.2.4m pertaining to clearances on a SID and 6.5.2.4 pertaining to clearances on a STAR.

4.7 VERTICAL SPEED CONTROL INSTRUCTIONS

4.7.1 General

4.7.1.1 In order to facilitate a safe and orderly flow of traffic, aircraft may be instructed to adjust rate of climb or rate of descent. Vertical speed control may be applied between two climbing aircraft or two descending aircraft in order to establish or maintain a specific vertical separation minimum.

- 4.7.1.2 Vertical speed adjustments should be limited to those necessary to establish and/or maintain a desired separation minimum. Instructions involving frequent changes of climb/descent rates should be avoided.
- 4.7.1.3 The flight crew shall inform the ATC unit concerned if unable, at any time, to comply with a specified rate of climb or descent. In such cases, the controller shall apply an alternative method to achieve an appropriate separation minimum between aircraft, without delay.
- 4.7.1.4 Aircraft shall be advised when a rate of climb/descent restriction is no longer required.

4.7.2 Methods of application

- 4.7.2.1 An aircraft may be instructed to expedite climb or descent as appropriate to or through a specified level, or may be instructed to reduce its rate of climb or rate of descent.
- 4.7.2.2 Climbing aircraft may be instructed to maintain a specified rate of climb, a rate of climb equal to or greater than a specified value or a rate of climb equal to or less than a specified value.
- 4.7.2.3 Descending aircraft may be instructed to maintain a specified rate of descent, a rate of descent equal to or greater than a specified value or a rate of descent equal to or less than a specified value.
- 4.7.2.4 In applying vertical speed control, the controller should ascertain to which level(s) climbing aircraft can sustain a specified rate of climb or, in the case of descending aircraft, the specified rate of descent which can be sustained, and shall ensure that alternative methods of maintaining separation can be applied in a timely manner, if required.

Note.— Controllers need to be aware of aircraft performance characteristics and limitations in relation to a simultaneous application of horizontal and vertical speed limitations.

4.8 CHANGE FROM IFR TO VFR FLIGHT

- 4.8.1** Change from instrument flight rules (IFR) flight to visual flight rules (VFR) flight is only acceptable when a message initiated by the pilot-in-command containing the specific

expression “CANCELLING MY IFR FLIGHT”, together with the changes, if any, to be made to the current flight plan, is received by an air traffic services unit. No invitation to change from IFR flight to VFR flight is to be made either directly or by inference.

4.8.2 No reply, other than the acknowledgment “IFR FLIGHT CANCELLED AT ... (time)”, should normally be made by an air traffic services unit.

4.8.3 When an ATS unit is in possession of information that instrument meteorological conditions are likely to be encountered along the route of flight, a pilot changing from IFR flight to VFR flight should, if practicable, be so advised.

Note.— See Chapter 11, 11.4.3.2.1.

4.8.4 An ATC unit receiving notification of an aircraft’s intention to change from IFR to VFR flight shall, as soon as practicable thereafter, so inform all other ATS units to whom the IFR flight plan was addressed, except those units through whose regions or areas the flight has already passed.

4.9 WAKE TURBULENCE

Note.— The term “wake turbulence” is used in this context to describe the effect of the rotating air masses generated behind the wing tips of aircraft, in preference to the term “wake vortex” which describes the nature of the air masses. Detailed characteristics of wake vortices and their effect on aircraft are contained in the Air Traffic Services Planning Manual (Doc 9426), Part II, Section 5.

4.9.1 Wake turbulence categories and groups of aircraft

4.9.1.1 Except as provided for 4.9.1.2, wake turbulence separation minima shall be based on a grouping of aircraft types into four categories according to the maximum certificated take-off mass as follows:

- a. SUPER (J) — aircraft types specified as such in ICAO Doc 8643, Aircraft Type Designators;

- b. HEAVY (H) — all aircraft types of 136 000 kg or more;
- c. MEDIUM (M) — aircraft types less than 136 000 kg but more than 7 000 kg; and
- d. LIGHT (L) — aircraft types of 7 000 kg or less.

Note — The wake turbulence category for each aircraft type is contained in Doc 8643, Aircraft Type Designators;

4.9.1.2 When approved by the appropriate ATS authority, wake turbulence separation minima may be applied utilizing wake turbulence groups and shall be based on wake generation and resistance characteristics of the aircraft. These depend primarily on maximum certified take-off mass, wing characteristics and speeds; the group designators are described as follows :

- a. GROUP A — aircraft types of 136 000 kg or more, and a wing span less than or equal to 80 m but greater than 74.68 m;
- b. GROUP B — aircraft types of 136 000 kg or more, and a wing span less than or equal to 74.68 m but greater than 53.34 m;
- c. GROUP C — aircraft types of 136 000 kg or more, and a wing span less than or equal to 53.34 m but greater than 38.1 m;
- d. GROUP D — aircraft types less than 136 000 kg but more than 18 600 kg, and a wing span greater than 32 m;
- e. GROUP E — aircraft types less than 136 000 kg but more than 18 600 kg, and a wing span less than or equal to 32 m but greater than 27.43 m;
- f. GROUP F — aircraft types less than 136 000 kg but more than 18 600 kg, and a wing span less than or equal to 27.43 m;
- g. GROUP G — aircraft types of 18 600 kg or less (without wing span criterion).

Note 1. — Information on the wake turbulence group for each aircraft type is contained in Doc

8643, Aircraft Type Designators.

Note 2. — Guidance on the implementation of wake turbulence separation between wake turbulence groups can be found in the Manual on Implementation of Wake Turbulence Separation Minima (Doc 10122).

4.9.1.2.1 Essential information, including the wake turbulence group designator as necessary, shall be provided to the controller when separation based on wake turbulence groups is to be applied.

4.9.1.3 Helicopters should be kept well clear of light aircraft when hovering or while air taxiing.

Note 1.— Helicopters produce vortices when in flight and there is some evidence that, per kilogram of gross mass, their vortices are more intense than those of fixed-wing aircraft. When hovering in ground effect or air taxiing, helicopters generate downwash producing high velocity outwash vortices to a distance approximately three times the diameter of the rotor.

Note 2.— The provisions governing wake turbulence separation minima are set forth in Chapter 5, Section 5.8, and Chapter 8, Section 8.7.3.

4.9.2 Indication of super or heavy wake turbulence category

For aircraft in the SUPER or HEAVY wake turbulence categories the word “super” or “heavy” shall be included, as appropriate, immediately after the aircraft call sign in the initial radiotelephony contact between such aircraft and ATS units.

Note 1.— Wake turbulence categories are specified in the instructions for completing Item 9 of the flight plan in Appendix 2.

Note 2. — Wake turbulence Group A is equivalent to the SUPER wake turbulence category, and Groups B and C are equivalent to the HEAVY category.

4.10 ALTIMETER SETTING PROCEDURES

4.10.1 Expression of vertical position of aircraft

4.10.1.1 For flights within Kathmandu FIR, the vertical position of aircraft shall be expressed in terms of altitudes at or below the transition altitude and in terms of flight levels at or above the transition level. While passing through the transition layer, vertical position shall be expressed in terms of flight levels when climbing and in terms of altitudes when descending.

4.10.1.2 When an aircraft which has been given clearance to land is completing its approach using atmospheric pressure at aerodrome elevation (QFE), the vertical position of the aircraft shall be expressed in terms of height above aerodrome elevation during that portion of its flight for which QFE may be used, except that it shall be expressed in terms of height above runway threshold elevation:

- a. for instrument runways, if the threshold is 2 m (7 ft) or more below the aerodrome elevation; and
- b. for precision approach runways.

4.10.1.3 For flights en route, the vertical position of aircraft shall be expressed in terms of:

- a. flight levels at or above the lowest usable flight level; and
- b. altitudes below the lowest usable flight level;

except where, on the basis of regional air navigation agreements, a transition altitude has been established for a specified area, in which case the provisions of 4.10.1.1 shall apply.

4.10.2 Determination of the transition level

4.10.2.1 The ANSP shall establish the transition level to be used within Kathmandu FIR on the basis of QNH (altimeter subscale setting to obtain elevation when on the ground) reports and forecast mean sea level pressure.

4.10.2.2 The transition level shall be the lowest flight level available for use above the transition altitude established by the ANSP.

4.10.3 Minimum cruising level for IFR flights

4.10.3.1 Except when specifically authorized, cruising levels below the minimum flight altitudes established by the ANSP shall not be assigned.

4.10.3.2 ATC units shall, when circumstances warrant it, determine the lowest usable flight level or levels for the whole or parts of the control area for which they are responsible, use it when assigning flight levels and pass it to pilots on request.

Note 1.— Unless otherwise prescribed by the ANSP, the lowest usable flight level is that flight level which corresponds to, or is immediately above, the established minimum flight altitude.

Note 2.— The portion of a control area for which a particular lowest usable flight level applies is determined in accordance with air traffic services requirements.

Note 3.— The objectives of the air traffic control service as prescribed in CAR 11 do not include prevention of collision with terrain. The procedures prescribed in this document do not relieve pilots of their responsibility to ensure that any clearances issued by air traffic control units are safe in this respect. When an IFR flight is vectored or is given a direct routing which takes the aircraft off an ATS route, the procedures in Chapter 8, 8.6.5.2 apply.

4.10.4 Provision of altimeter setting information

4.10.4.1 Appropriate ATS units shall at all times have available for transmission to aircraft in flight, on request, the information required to determine the lowest flight level which will ensure adequate terrain clearance on routes or segments of routes for which this information is required.

Note.— If so prescribed on the basis of regional air navigation agreements, this information may consist of climatological data.

4.10.4.2 Flight information centres and ACCs shall have available for transmission to aircraft, on request, an appropriate number of QNH reports or forecast pressures for the FIRs and control areas for which they are responsible, and for those adjacent.

4.10.4.3 The flight crew shall be provided with the transition level in due time prior to reaching it during descent. This may be accomplished by voice communications, ATIS broadcast or data

link.

4.10.4.4 The transition level shall be included in approach clearances when so prescribed by the appropriate authority or requested by the pilot.

4.10.4.5 A QNH altimeter setting shall be included in the descent clearance when first cleared to an altitude below the transition level, in approach clearances or clearances to enter the traffic circuit, and in taxi clearances for departing aircraft, except when it is known that the aircraft has already received the information.

4.10.4.6 A QFE altimeter setting will be provided on request if available but reports to ATC are to be made in altitude.

4.10.4.7 Altimeter settings provided to aircraft shall be rounded down to the nearest lower whole hectopascal.

4.10.5 Altimeter Setting Procedure

4.10.5.1 An altimeter setting is pressure datum which, when set on the sub-scale of a sensitive altimeter, causes the altimeter to indicate vertical distance from that pressure datum. A pressure type altimeter calibrated in accordance with the international standard atmosphere (ISA) may be used to indicate altitude, flight level or height as follows:

- a. When set to set to QNH it will indicate altitude. An altimeter set to QNH reads, within close limits, the vertical distance above mean sea level of the aircraft is on the ground at the aerodrome, the altimeter will register the elevation of the aerodrome above mean sea level.
- b. When set to standard pressure (1013.2 hpa) it may be used to indicated flight levels. An aircraft maintains a flight level with the altimeter set to standard pressure flying along a surface of constant atmosphere pressure. The aircraft's vertical distance from mean sea level may vary while the aircraft maintains the flight level due to

change in atmospheric pressure en route in the horizontal, for example, an aircraft flying toward a low pressure area will fly progressively lower while maintaining a flight level.

- c. When set to QFE, it will indicate height above the QFE reference datum. Maximum variation on QNH values within Kathmandu FIR does not exceed 15 hpa either side of the standard of setting 1013.2 hpa representing the change of 450 ft. on the altimeter from QNH to 1013.2 hpa. To simplify ATC procedures, therefore, a transition level of FL 150 has been established, thus provides a transition layer of 1500ft. and ensures at all times the 1000ft. vertical separation between aircraft.

4.10.5.2 The system of altimetry used in Kathmandu FIR (VNSM) makes use of a transition layer to separate aircraft using QNH from those using 1013.2 hpa (hectopascal)

4.10.5.3 A common transition altitude of 13500ft. has been established for the entire Kathmandu Flight Information Region.

4.10.5.4 A transition level of FL 150 has been established for the entire Kathmandu Flight Information Region.

4.10.5.5 All aircraft at or below the transition altitude will use Kathmandu, QNH supplied by ATS units. At controlled aerodromes other than Kathmandu, inbound aircraft will set local QNH at the control zone boundary and outbound aircraft will change from local QNH to Kathmandu QNH on leaving the control zone boundary

4.10.5.6 For the flight at or above the transition level, the standard altimeter setting of 1013.2 hpa will be used.

4.10.5.7 Change from QNH to 1013.2 hpa will be made on climbing through the transition altitude.

4.10.5.8 Change from 1013.2 hpa. To QNH will be made on descent through the transition level.

4.10.5.9 Cruising within the transition layer is not permitted.

4.10.5.10 Flight level zero is located at the atmospheric pressure level of 1013.2 hpa. Consecutive flight

levels are separated by a pressure level corresponding to 500ft. in the standard atmosphere, for example FL 150, FL 155, FL 160 etc.

4.10.5.11 A QNH altimeter setting shall be made available to aircraft by approach/aerodrome control in the routine take off and climb instruction.

Note: Example of the relationship between flight levels and altimeter indications are given in the following table.

| FLIGHT LEVEL | ALTIMETER INDICATION |
|--------------|----------------------|
| 150 | 15,000 |
| 200 | 20,000 |
| 250 | 25,000 |
| 300 | 30,000 |
| 350 | 35,000 |
| 400 | 40,000 |
| 450 | 45,000 |

4.11 POSITION REPORTING

4.11.1 Transmission of position reports

4.11.1.1 On routes defined by designated significant points, position reports shall be made by the aircraft when over, or as soon as possible after passing, each designated compulsory reporting point, except as provided in 4.11.1.3 and 4.11.3. Additional reports over other points may be requested by the appropriate ATS unit.

4.11.1.2 On routes not defined by designated significant points, position reports shall be made

by the aircraft as soon as possible after the first half hour of flight and at hourly intervals thereafter, except as provided in 4.11.1.3. Additional reports at shorter intervals of time may be requested by the appropriate ATS unit.

4.11.1.3 Under conditions specified by the appropriate ATS authority, flights may be exempted from the requirement to make position reports at each designated compulsory reporting point or interval. In applying this, account should be taken of the meteorological requirement for the making and reporting of routine aircraft observations.

4.11.1.4 The position reports required by 4.11.1.1 and 4.11.1.2 shall be made to the ATS unit serving the airspace in which the aircraft is operated. In addition, when requested by the appropriate ATS unit, the last position report before passing from one FIR or control area to an adjacent FIR or control area shall be made to the ATS unit serving the airspace about to be entered.

4.11.1.5 If a position report is not received at the expected time, subsequent control shall not be based on the assumption that the estimated time is accurate. Immediate action shall be taken to obtain the report if it is likely to have any bearing on the control of other aircraft.

4.11.2 Contents of voice position reports

4.11.1.6 The position reports required by 4.11.1.1 and 4.11.1.2 shall contain the following elements of information, except that elements d), e) and f) may be omitted from position reports transmitted by radiotelephony:

- a. aircraft identification;
- b. position;
- c. time;
- d. flight level or altitude, including passing level and cleared level if not maintaining the cleared level;
- e. next position and time over; and
- f. ensuing significant point.

4.11.2.1.1. Element d), flight level or altitude, shall, however, be included in the initial call after a change of air-ground voice communication channel.

4.11.2.2. When assigned a speed to maintain, the flight crew shall include this speed in their position reports. The assigned speed shall also be included in the initial call after a change of air-ground voice communication channel, whether or not a full position report is required.

Note.— Omission of element d) may be possible when flight level or altitude, as appropriate, derived from pressure-altitude information can be made continuously available to controllers in labels associated with the position indication of aircraft and when adequate procedures have been developed to guarantee the safe and efficient use of this altitude information.

4.11.3 Radiotelephony procedures for air-ground voice communication channel changeover

When so prescribed by ANSP, the initial call to an ATC unit after a change of air-ground voice communication channel shall contain the following elements:

- a. designation of the station being called;
- b. call sign and, for aircraft in the SUPER and HEAVY wake turbulence categories, the word “super” or “heavy” respectively;
- c. level, including passing and cleared levels if not maintaining the cleared level;
- d. speed, if assigned by ATC; and
- e. additional elements, as required by ANSP.

4.12 REPORTING OF OPERATIONAL AND METEOROLOGICAL INFORMATION

4.12.1 General

4.12.1.1. When operational and/or meteorological information is to be reported, by an aircraft en route at times where position reports are required in accordance with 4.11.1.1 and 4.11.1.2, the special aircraft observations shall be reported as special air-reports as soon as practicable.

4.12.1.2. When operational and/or meteorological information is to be reported, by an aircraft en route at times where position reports are required in accordance with 4.11.1.1 and 4.11.1.2, the special aircraft observations shall be reported as special air-reports as soon as practicable.

4.12.2 Contents of routine air-reports

4.12.2.1. Routine air-reports transmitted by data link, when ADS-C is not being applied, shall give information relating to such of the following elements as are necessary for compliance with 4.12.2.2:

Section 1.— Position information:

- a. aircraft identification
- b. position
- c. time
- d. flight level or altitude
- e. next position and time over
- f. ensuing significant point

Section 2.— Operational information:

- g. estimated time of arrival
- h. endurance

Section 3.— Meteorological information:

- i. wind direction
- j. wind speed
- k. wind quality flag
- l. air temperature
- m. turbulence (if available)
- n. humidity (if available).

4.12.2.2. Section 1 of the air-report is obligatory, except that elements 5) and 6) thereof may be

omitted when so prescribed on the basis of regional air navigation agreements. Section 2 of the air-report, or a portion thereof, shall only be transmitted when so requested by the operator or a designated representative, or when deemed necessary by the pilot-in-command. Section 3 of the air-report shall be transmitted in accordance with CAR 3, Chapter 5.

Note.— While element 4), flight level or altitude, may, in accordance with 4.11.2.1, be omitted from the contents of a position report transmitted by radiotelephony when so prescribed on the basis of regional air navigation agreements, that element may not be omitted from Section 1 of an air-report.

4.12.3 Contents of special air-reports

4.12.3.1. Special air-reports shall be made by all aircraft whenever the following conditions are encountered or observed:

- a. moderate or severe turbulence; or
- b. moderate or severe icing; or
- c. severe mountain wave; or
- d. thunderstorms, without hail that are obscured, embedded, widespread or in squall lines; or
- e. thunderstorms, with hail that are obscured, embedded, widespread or in squall lines; or
- f. heavy duststorm or heavy sandstorm; or
- g. volcanic ash cloud; or
- h. pre-eruption volcanic activity or a volcanic eruption.
- i. as of 4 November 2021 runway braking action encountered is not as good as reported.

Note.— Pre-eruption volcanic activity in this context means unusual and/or increasing volcanic activity which could presage a volcanic eruption.

In addition, in the case of transonic and supersonic flight:

- j. moderate turbulence; or
- k. hail; or
- l. cumulonimbus clouds.

4.12.3.2. When air-ground data link is used, special air-reports shall contain the following elements:

message type designator

aircraft identification

Data block 1:

- latitude
- longitude
- pressure-altitude
- time

Data block 2:

- wind direction
- wind speed
- wind quality flag
- air temperature
- turbulence (if available)
- humidity (if available)

Data block 3:

condition prompting the issuance of the special air-report; to be selected from the list a) to k) presented under 4.12.3.1.

4.12.3.3. When voice communications are used, special air-reports shall contain the following elements:

Message type designator

Section 1.— Position information

1. aircraft identification
2. position
3. time
4. flight level or altitude

Section 3.— Meteorological information

1. condition prompting the issuance of the special air-report; to be selected from the list a) to h) presented under 4.12.2.1.

4.12.4 Compilation and transmission of air-reports by voice communications

- 4.12.4.1. Forms based on the model AIREP SPECIAL form at Appendix 1 shall be provided for the use of flight crews in compiling the reports. The detailed instructions for reporting, as given at Appendix 1, shall be complied with.
- 4.12.4.2. The detailed instructions, including the formats of messages and the phraseologies given at Appendix 1, shall be used by flight crews when transmitting air-reports and by air traffic services units when retransmitting such reports.
- 4.12.4.3. As of 5 November 2020, when receiving special air-reports by voice communications, air traffic services units shall forward them without delay to their associated meteorological watch offices, with the exception of conditions applying to runway braking action encountered.

Note.— Increasing use of air-reports in automated systems makes it essential that the elements of such reports be transmitted in the order and form prescribed.

4.12.5 Recording of special air-reports of volcanic activity

Special air-reports containing observations of volcanic activity shall be recorded on the special air report of volcanic activity form. Forms based on the model form for special air-reports of volcanic activity at Appendix 1 shall be provided for flight crews operating on routes which could be affected by volcanic

ash clouds

Note.— The recording and reporting instructions may conveniently be printed on the back of the special air-report of volcanic activity form.

4.12.6 Forwarding of meteorological information

4.12.6.1. When receiving ADS-C reports which contain a meteorological information block, air traffic services units shall relay the basic ADS-C and meteorological information blocks and aircraft registration without delay to the world area forecast centres (WAFCs).

Note.— Specifications concerning the format to be used in the relay of meteorological information to the WAFCs are contained in the Manual on Aeronautical Meteorological Practice (Doc 8896).

4.12.6.2. When receiving special air-reports by data link communications, air traffic services units shall forward them without delay to their associated meteorological watch office, the WAFCs, and the centres designated by regional air navigation agreement for the operation of aeronautical fixed service Internet-based services.

4.12.6.3. When receiving special air-reports by voice communications, air traffic services units shall forward them without delay to their associated meteorological watch offices, with the exception of conditions applying to runway braking action encountered.

4.12.7 Forwarding of braking action information

When receiving special air-reports by voice communications concerning braking action encountered that is not as good as reported, air traffic service units shall forward them without delay to the appropriate aerodrome operator.

4.13 PRESENTATION AND UPDATING OF FLIGHT PLAN AND CONTROL DATA

4.13.1 General

ATC units shall establish provisions and procedures for the presentation to controllers, and subsequent updating, of flight plan and control data for all flights being provided with a service by an ATS unit. Provision shall also be made for the presentation of any other information required or desirable for the provision of ATS.

4.13.2 Information and data to be presented

4.13.2.1. Sufficient information and data shall be presented in such a manner as to enable the controller to have a complete representation of the current air traffic situation within the controller's area of responsibility and, when relevant, movements on the manoeuvring area of aerodromes. The presentation shall be updated in accordance with the progress of aircraft, in order to facilitate the timely detection and resolution of conflicts as well as to facilitate and provide a record of coordination with adjacent ATS units and control sectors.

4.13.2.2. An appropriate representation of the airspace configuration, including significant points and information related to such points, shall be provided. Data to be presented shall include relevant information from flight plans and position reports as well as clearance and coordination data. The information display may be generated and updated automatically, or the data may be entered and updated by authorized personnel.

4.13.2.3. Requirements regarding other information to be displayed, or to be available for display, shall be specified by the appropriate authority.

4.13.3 Presentation of information and data

4.13.3.1. The required flight plan and control data may be presented through the use of paper flight progress strips or electronic flight progress strips, by other electronic presentation forms or by a combination of presentation methods.

4.13.3.2. The method(s) of presenting information and data shall be in accordance with Human Factors principles. All data, including data related to individual aircraft, shall be presented

in a manner minimizing the potential for misinterpretation or misunderstanding.

4.13.3.3. Means and methods for manually entering data in ATC automation systems shall be in accordance with Human Factors principles.

4.13.3.4. When flight progress strips (FPS) are used, there should be at least one individual FPS for each flight. The number of FPS for individual flights shall be sufficient to meet the requirements of the ATS unit concerned. Procedures for annotating data and provisions specifying the types of data to be entered on FPS, including the use of symbols, shall be specified by the ATS units.

Note.— Guidance material on the use of paper FPS is contained in the Air Traffic Services Planning Manual (Doc 9426).

4.13.3.5. Data generated automatically shall be presented to the controller in a timely manner. The presentation of information and data for individual flights shall continue until such time as the data is no longer required for the purpose of providing control, including conflict detection and the coordination of flights, or until terminated by the controller.

4.14 FAILURE OR IRREGULARITY OF SYSTEMS AND EQUIPMENT

ATC units shall immediately report in accordance with local instructions any failure or irregularity of communication, navigation and surveillance systems or any other safety-significant systems or equipment which could adversely affect the safety or efficiency of flight operations and/or the provision of air traffic control service to chief of airport.

CHAPTER 5

SEPARATION METHODS AND MINIMA

5.1 INTRODUCTION

Note 1.— With the exceptions stated below, Chapter 5 contains procedures and procedural separation minima for use in the separation of aircraft in the en-route phase as well as aircraft in the arrival and departure phases of flight.

Note 2.— Procedures and separation minima applicable in the provision of aerodrome control service are contained in Chapter 7 and procedures and separation minima applicable to the use of ATS surveillance systems are contained in Chapter 8.

Note 3.— Attention is drawn to the use of strategic lateral offset procedures (SLOP) described in Chapter 16, 16.5.

5.2 PROVISIONS FOR THE SEPARATION OF CONTROLLED TRAFFIC

5.2.1 General

5.2.1.1. Vertical or horizontal separation shall be provided:

- a. between IFR flights in Class C airspace;
- b. between IFR flights and VFR flights in Class C airspace;
- c. between IFR flights and special VFR flights; and
- d. between special VFR flights;

5.2.1.2. No clearance shall be given to execute any manoeuvre that would reduce the spacing between two aircraft to less than the separation minimum applicable in the circumstances.

5.2.1.3. Larger separations than the specified minima should be applied whenever exceptional circumstances such as unlawful interference or navigational difficulties call for extra precautions. This should be done with due regard to all relevant factors so as to avoid

impeding the flow of air traffic by the application of excessive separations.

Note.— Unlawful interference with an aircraft constitutes a case of exceptional circumstances which might require the application of separations larger than the specified minima, between the aircraft being subjected to unlawful interference and other aircraft.

- 5.2.1.4. Where the type of separation or minimum used to separate two aircraft cannot be maintained, another type of separation or another minimum shall be established prior to the time when the current separation minimum would be infringed.

5.2.2 Degraded aircraft performance

Whenever, as a result of failure or degradation of navigation, communications, altimetry, flight control or other systems, aircraft performance is degraded below the level required for the airspace in which it is operating, the flight crew shall advise the ATC unit concerned without delay. Where the failure or degradation affects the separation minimum currently being employed, the controller shall take action to establish another appropriate type of separation or separation minimum.

5.3 VERTICAL SEPARATION

5.3.1 Vertical separation application

Vertical separation is obtained by requiring aircraft using prescribed altimeter setting procedures to operate at different levels expressed in terms of flight levels or altitudes in accordance with the provisions in Chapter 4, Section 4.10.

5.3.2 Vertical separation minimum

- a. a nominal 300 m (1 000 ft) below FL 290 and a nominal 600 m (2 000 ft) at or above this level, except as provided for in b) below; and
- b. within designated airspace, subject to a regional air navigation agreement: a nominal 300 m (1 000 ft) below FL 410 or a higher level where so prescribed for use under specified conditions, and a nominal 600 m (2 000 ft) at or above this level.

Note.1— Guidance material relating to vertical separation is contained in the Manual on a 300

m (1 000 ft) Vertical Separation Minimum Between FL 290 and FL 410 Inclusive (Doc 9574).

Note.2— ANSP has to develop mechanism for monitoring large deviation within RVSM airspace and Report such information to monitoring agency for Asia Region. (MAAR)

5.3.3 Assignment of cruising levels for control

5.3.3.1. An ATC unit shall normally authorize only one level for an aircraft beyond its control area, i.e. that level at which the aircraft will enter the next control area whether contiguous or not. It is the responsibility of the accepting ATC unit to issue clearance for further climb as appropriate. When relevant, aircraft will be advised to request en route any cruising level changes desired.

5.3.3.2. If it is necessary to change the cruising level of an aircraft operating along an established ATS route extending partly within and partly outside controlled airspace and where the respective series of cruising levels are not identical, the change shall, whenever possible, be effected within controlled airsp

5.3.3.3. When an aircraft has been cleared into a control area at a cruising level which is below the established minimum cruising level for a subsequent portion of the route, the ATC unit responsible for the area should issue a revised clearance to the aircraft even though the pilot has not requested the necessary cruising level change.

5.3.3.4. An aircraft may be cleared to change cruising level at a specified time, place or rate.

Note.— See 5.3.4.1.1 concerning procedures for vertical speed control.

5.3.3.5. In so far as practicable, cruising levels of aircraft flying to the same destination shall be assigned in a manner that will be correct for an approach sequence at destination.

5.3.3.6. An aircraft at a cruising level shall normally have priority over other aircraft requesting that cruising level. When two or more aircraft are at the same cruising level, the preceding aircraft shall normally have priority.

5.3.3.7. The cruising levels to be assigned to controlled flights shall be selected from those allocated

In the tables of cruising levels in Appendix 2 of CAR 2.

5.3.4 Vertical separation during climb or descent

5.3.4.1. An aircraft may be cleared to a level previously occupied by another aircraft after the latter has reported vacating it, except when

- a. severe turbulence is known to exist;
- b. the difference in aircraft performance is such that less than the applicable separation minimum may result; -in which case such clearance shall be withheld until the aircraft vacating the level has reported at or passing another level separated by the required minimum.

5.3.4.1.1. When the aircraft concerned are entering or established in the same holding pattern, consideration shall be given to aircraft descending at markedly different rates and, if necessary, additional measures such as specifying a maximum descent rate for the higher aircraft and a minimum descent rate for the lower aircraft should be applied to ensure that the required separation is maintained.

5.3.4.2. Pilots in direct communication with each other may, with their concurrence, be cleared to maintain a specified vertical separation between their aircraft during ascent or descent.

5.4 HORIZONTAL SEPARATION

5.4.1 Lateral separation

5.4.1.1. LATERAL SEPARATION APPLICATION

5.4.1.1.1. Lateral separation shall be applied so that the distance between those portions of the intended routes for which the aircraft are to be laterally separated is never less than an established distance to account for navigational inaccuracies plus a specified buffer. This buffer shall be determined by the ANSP and included in the lateral separation minima as an integral part thereof.

Note.— In the minima specified in 5.4.1.2 an appropriate buffer has already been included.

5.4.1.1.2. Lateral separation of aircraft is obtained by requiring operation on different routes or in different geographical locations as determined by visual observation, by the use of navigation aids or by the use of area navigation (RNAV) equipment.

5.4.1.1.3. When information is received indicating navigation equipment failure or deterioration below the navigation performance requirements, ATC shall then, as required, apply alternative separation methods or minima.

5.4.1.1.4. Where a route flown by an aircraft involves a specific turn which will result in the minimum lateral separation being infringed, another type of separation or another minimum shall be established prior to the aircraft commencing the turn. (see Figures 5-1 and 5-2).

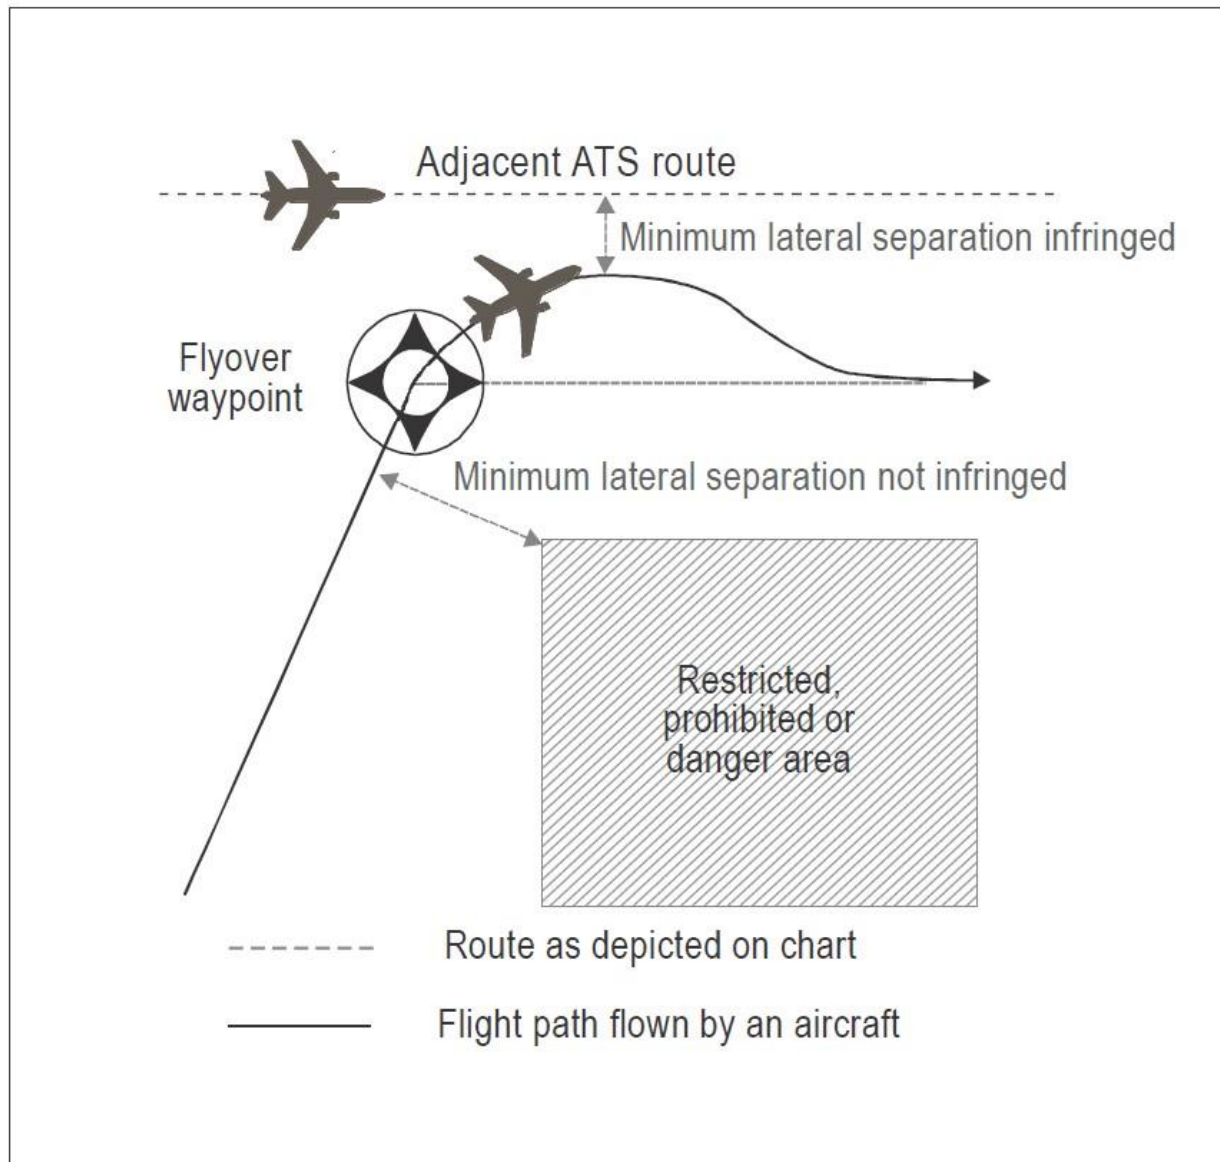

Note 1.— For flyover waypoints aircraft are required to first fly over the waypoint before executing the turn. After the turn the aircraft may either navigate to join the route immediately after the turn or navigate to the next defined waypoint before re-joining the route. This will require additional lateral separation on the overflown side of the turn. (Refer to Figure 5-1).

Note 2.—An aircraft may commence a fly-by turn upto 37 km (20NM) prior to turn waypoint and fly a path displayed From that waypoint by as much as 16.7 km (9.0NM). The defined radius for the Fixed Radius Transition (FRT) turn dictates how early the aircraft starts the turn and the displacement from the waypoint. Fly by and FRT turns therefore, have the possibility of affecting a restricted area or another route on the inside of the turn. For instrument flight procedures, the Radius arc to a Fix(RF) path terminator will provide consistence turn performance (refer to Figure 5-1 and 5-2). Further details on this issue can be found in the Manual on the Use of Performance –based Navigation (PBN) in Airspace Design(Doc. 999 Note 3.— An example of a prescribed lateral separation minima based on a specific navigation performance can be found in5.4.1.2.1.6.

Fly By Turns

An aircraft will calculate a turn radius and angle of bank (AOB) subject to performance characteristics, airspeed, altitude, angle of turn and wind conditions. The aircraft determine to initiate the turn, prior to the waypoint, based on the calculated radius — this may be up to 20 NM before the waypoint. There will be a variation in the paths because each aircraft calculates its own turn radius (indicated by the grey area in the figure within which the flight path of the aircraft will be located). This variation becomes more apparent at higher altitudes and greater turn angles. The controller can expect the aircraft track to be on the inside of the waypoint.

Flyover turns

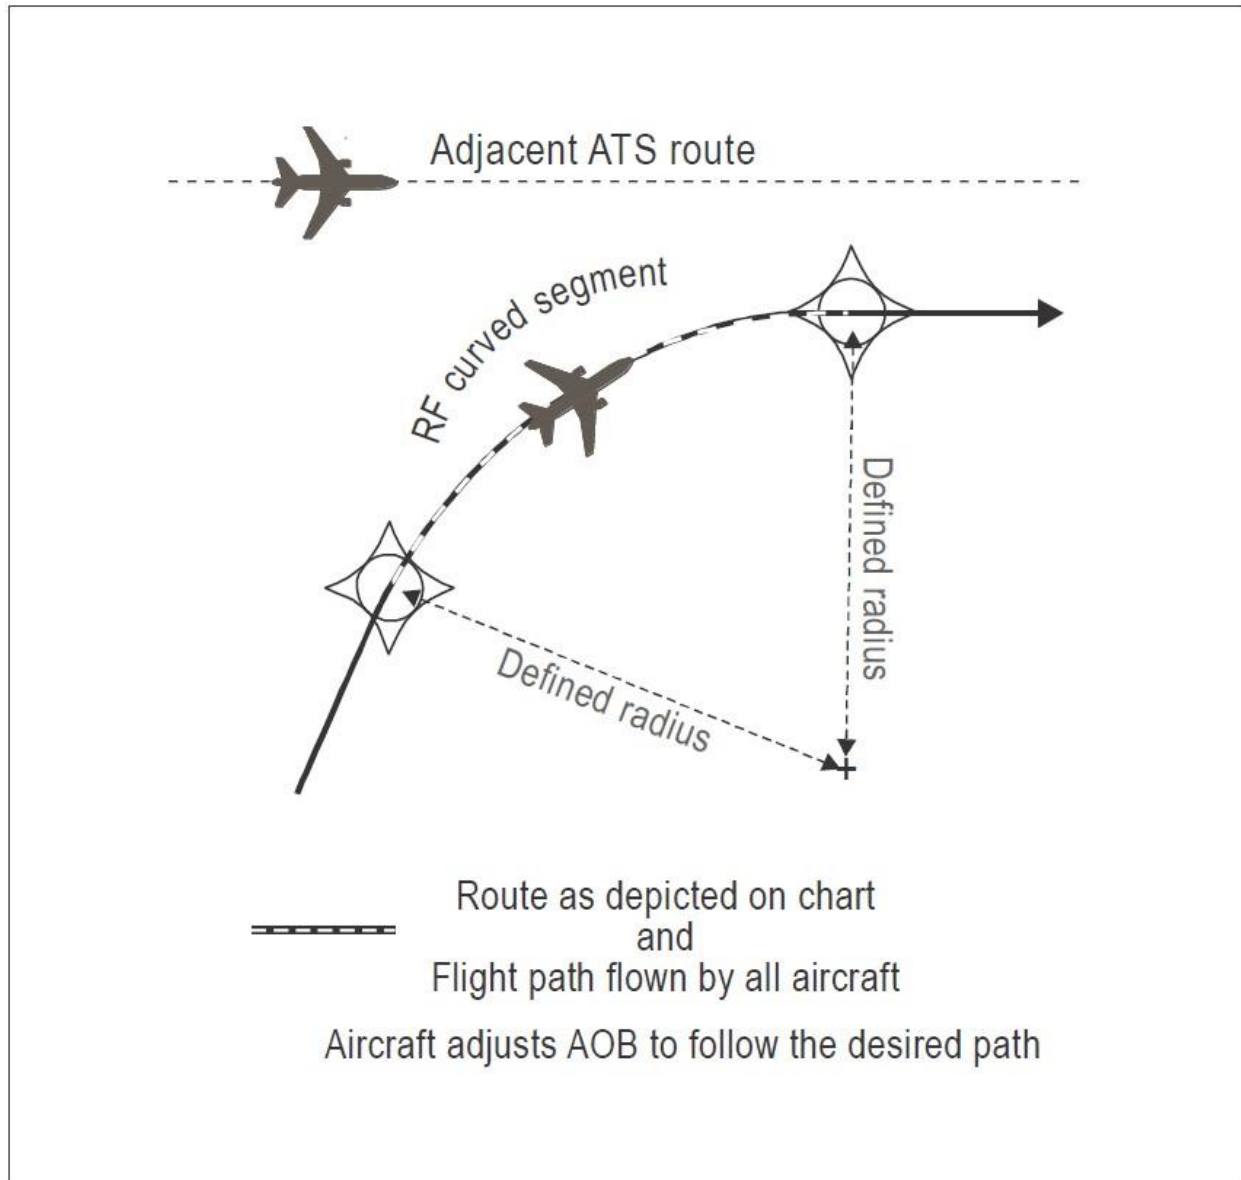

An aircraft will come to the overhead of the waypoint before initiating the turn onto the next leg. Therefore, if the minimum prescribed lateral separation is applied, it will be infringed upon as the aircraft manoeuvres onto its next leg. The controller can expect the aircraft track to be on the outside of the waypoint.

Figure 5-1. Turn over flyover waypoint and turn at fly-by waypoint (see 5.4.1.1.4)

Fixed radius transition (FRT)

An FRT for published en-route RNP ATS routes has a turn radius specified by the airspace planner. Approaching the waypoint, the FMC/FMS will calculate the arc centre and will initiate the turn at a point at which the flight path is perpendicular to the radius which links the point to the calculated centre. This turn type should provide highly consistent and repeatable turn performance.

Radius arc to a fix (RF)

An RF for instrument flight procedures (IFP) is a curved route segment that has been designed with a published radius and arc centre. Aircraft will initiate the turn at the waypoint defining the start of the curved segment and will follow the published route until the next waypoint. This turn type should provide highly consistent and repeatable turn performance.

Figure 5-2. Fixed radius transition (FRT) and radius arc to a fix (RF) turn (see 5.4.1.1.4)

5.4.1.2. LATERAL SEPARATION CRITERIA AND MINIMA

5.4.1.2.1. Means by which lateral separation may be applied include the following:

5.4.1.2.1.1. *By reference to the same or different geographic locations.* By position reports which positively indicate the aircraft are over different geographic locations as determined visually or by reference to a navigation aid (see Figure 5-3).

5.4.1.2.1.2. *By use of NDB, VOR or GNSS on intersecting tracks or ATS routes.* By requiring aircraft to fly on specified tracks which are separated by a minimum amount appropriate to the navigation aid employed. Lateral separation between two aircraft exists when:

- a. *VOR:* both aircraft are established on radials diverging by at least 15 degrees and at least one aircraft is at a distance of 28 km (15 NM) or more from the facility (see Figure 5-4);
- b. *NDB:* both aircraft are established on tracks to or from the NDB which are diverging by at least 30 degrees and at least one aircraft is at a distance of 28 km (15 NM) or more from the facility (see Figure 5-5);
- c. *GNSS/GNSS:* each aircraft is confirmed to be established on a track with zero offset between two waypoints and at least one aircraft is at a minimum distance from a common point as specified in Table 5-1; or
- d. *VOR/GNSS:* the aircraft using VOR is established on a radial to or from the VOR and the other aircraft using GNSS is confirmed to be established on a track with zero offset between two waypoints and at least one aircraft is at a minimum distance from a common point as specified in Table 5-1.

Table 5-1. Lateral separation for aircraft flying VOR and GNSS

| | <i>Aircraft 1: VOR or GNSS</i> <i>Aircraft 2: GNSS</i> | |
|---|---|---|
| Angular difference between tracks measured at the common point (degrees) | FL010 - FL190 Distance from a common point | FL200 - FL600 Distance from a common point |
| 15 - 135 | 27.8 km (15 NM) | 43 km (23 NM) |
| The distances in the table are ground distances. States must take into account the distance (slant range) from the source of a DME signal to the receiving antenna when DME is being utilized to provide range information. | | |

Note 1.— The values in Table 5-1 are from a larger table of values derived by collision risk analysis. The source table for separation of aircraft navigating by means of GNSS and VOR is contained in Circular 322, Guidelines for the Implementation of GNSS Lateral Separation Minima based on VOR Separation Minima. States may refer to Circular 322 for greater detail and other angular differences and separation distances.

Note 2.— The values in Table 5-1 have accounted for distances from the common point encompassed by the theoretical turn area for fly-by turns as specified in the Minimum Aviation System Performance Standard: Required Navigation Performance for Air Navigation (ED-75B/DO-236B), section 3.2.5.4, and fixed radius transition turns as defined in the Performance-based Navigation (PBN) Manual (Doc 9613).

Note 3.— Guidance material for the implementation of GNSS lateral separation is contained in Circular 322, Guidelines for the Implementation of GNSS Lateral Separation Minima Based on VOR Separation Minima.

Figure 5-3. Using same or different geographic locations (see 5.4.1.2.1.1)

Figure 5-4. Separation using the same VOR (see 5.4.1.2.1.2 a))

Figure 5-5. Separation using the same NDB (see 5.4.1.2.1.2 b))

5.4.1.2.1.2.1. When aircraft are operating on tracks which are separated by considerably more than the minimum in 5.4.1.2.1.2 a) and b), States may reduce the distance at which lateral separation is achieved.

5.4.1.2.1.2.2. Before applying GNSS-based track separation, the controller shall confirm the following:

- a. ensure that the aircraft is navigating using GNSS; and
- b. in airspace where strategic lateral offsets are authorized, that a lateral offset is not being applied.

5.4.1.2.1.2.3. In order to minimize the possibility of operational errors, waypoints contained in the navigation database or uplinked to the aircraft flight management system should be used in lieu of manually entered waypoints, when applying GNSS-based track separation. In the event that it is operationally restrictive to use waypoints contained in the navigation database, the use of waypoints that require manual entry by pilots should be limited to a half or whole degree of latitude and longitude.

5.4.1.2.1.2.4. GNSS-based track separation shall not be applied in cases of pilot-reported

receiver autonomous integrity monitoring (RAIM) outages.

Note.— For the purpose of applying GNSS-based lateral separation minima, distance and track information derived from an integrated navigation system incorporating GNSS input is regarded as equivalent to GNSS distance and track.

5.4.1.2.1.2.5. GNSS receivers used for applying separation shall meet the requirements in Annex 10, Volume I, and be indicated in the flight plan.

5.4.1.2.1.3. *By use of different navigation aids or methods.* Lateral separation between aircraft using different navigation aids, or when one aircraft is using RNAV equipment, shall be established by ensuring that the derived protected airspaces for the navigation aid(s) or RNP do not overlap.

5.4.1.2.1.4. *Lateral separation of aircraft on published instrument flight procedures for arrivals and departures.*

5.4.1.2.1.4.1. Lateral separation of departing and/or arriving aircraft, using instrument flight procedures, will exist:

- a. where the distance between any combination of RNAV 1 with RNAV 1, or RNP 1, RNP APCH or RNP AR APCH tracks is not less than 13 km (7 NM); or
- b. where the distance between any combination of RNP 1, RNP APCH or RNP AR APCH tracks is not less than
- c. 9.3 km (5 NM); or
- d. where the protected areas of tracks designed using obstacle clearance criteria do not overlap and provided operational error is considered.

Note 1.— Distance values contained in a) and b) above were determined by collision risk analysis using multiple navigation specifications. Information on this analysis is contained in Circular 324, Guidelines for Lateral Separation of Arriving and Departing Aircraft on Published Adjacent Instrument Flight Procedures.

Note 2.— Circular 324 also contains information on separation of arrival and departure tracks using non-overlapping protected areas based on obstacle clearance criteria, as provided for in the Procedures for Air Navigation Services — Aircraft Operations, Volume II — Construction of Visual and Instrument Flight Procedures (PANS-OPS, Doc 8168).

Note 3.— Provisions concerning reductions in separation minima are contained in Chapter 2, ATS Safety Management, and Chapter 5, Separation Methods and Minima, Section 5.11.

Note 4.— Guidance concerning the navigation specifications is contained in the Performance-based Navigation (PBN) Manual (Doc 9613).

5.4.1.2.1.5. *RNAV operations where RNP is specified on parallel tracks or ATS routes.* Within designated airspace or on designated routes, where RNP is specified, lateral separation between RNAV-equipped aircraft may be obtained by requiring aircraft to be established on the centre lines of parallel tracks or ATS routes spaced at a distance which ensures that the protected airspace of the tracks or ATS routes does not overlap.

5.4.1.2.1.6. *Lateral separation of aircraft on parallel or non-intersecting tracks or ATS routes.* Within designated airspace or on designated routes, lateral separation between aircraft operating on parallel or non-intersecting tracks or ATS routes shall be established in accordance with table 5-2.

Table 5-2 Lateral separation of aircraft on parallel or non-intersecting tracks or ATS routes.

| <i>Minimum Spacing between tracks</i> | | <i>Performance Requirements</i> | | | <i>Additional Requirements</i> |
|---|---|------------------------------------|---|---------------------|---|
| <i>Airspace where SLOP is not Authorized or is only authorized Upto 0.5 NM.</i> | <i>Airspace where SLOP upto 2 NM is authorized.</i> | <i>Navigation</i> | <i>Communication</i> | <i>Surveillance</i> | |
| 93 km (50 NM) | 93 km (50 NM) | RNAV 10 (RNP 10) RNP 4 RNP 2 | Types of Communication other than Direct controller-pilot VHF voice | | |
| 37 km (20 NM) | 42.6 km (23 NM) | RNP 4 RNP 2 | RCP 240 | | Conformance monitoring shall be ensured by establishing an ADS-C event contract specifying a lateral deviation change event with a maximum of 5 NM threshold & a waypoint change. |
| 37 km (20 NM) | 42.6 km (23 NM) | RNP 2 Or GNSS Equipage | Types of communication other than Direct controller-pilot VHF voice | | While one aircraft climbs/descends through the level of another aircraft remaining in level flight. |
| 27.8 km (15NM) | 33.4 km (18 NM) | RNP 2 Or GNSS Equipage | Direct controller pilot VHF voice communication | | |

| | | | | | |

Note 1– Guidance material for the implementation of the navigation capability supporting the lateral separation minima above is contained in the performance based Navigation (PBN) Manual (Doc. 9613) . Information regarding the implementation of the lateral separation minima above is contained in Circular 349. Guidance for the implementation of Lateral Separation Minima.

Note 2– Guidance material for the implementation of communication and surveillance capability supporting the lateral separation minima above is contained in the performance based communication and surveillance (PBCS) Manual (Doc 9869) and the Global Operational Data Link (GOLD) Manual (Doc 10037).

Note 3– See Appendix 2, ITEM 10: EQUIPMENT AND CAPABILITIES in relation to the GNSS prescribed in Table 5-2. Note 4– Refer to 16.5 for further details regarding application of strategic lateral offset procedures (SLOP).

5.4.1.2.1.7. When the minima is 5.4.1.2.1.6 are applied by requiring one or both aircraft to establish a specified lateral A specified lateral offset, vertical separation shall be maintained by the controller until the manoeuvring aircraft is Established on the applicable lateral offset.

- a. an aircraft converging with the track of another aircraft is laterally separated until it reaches a lateral separation point that is located a specified distance measured perpendicularly

- from the track of the other aircraft (see Figure 5-6); and
- b. an aircraft diverging from the track of another aircraft is laterally separated after passing a lateral separation point that is located a specified distance measured perpendicularly from the track of the other aircraft (see Figure 5-6).

This type of separation may be used for tracks that intersect at any angles using the values for lateral separation points specified below:

5.4.1.2.1.8. When applying the 27.8 km (15 NM) separation minima specified in the table above, a GNSS, as indicated in the flight plan by the letter G meets the specified navigation perform

Note.— Guidance material for the implementation of the navigation capability supporting 93 km (50 NM), 42.6 km (23 NM), and 27.8 km (15 NM) lateral separation minima is contained in the Performance-based Navigation (PBN) Manual (Doc 9613). Supporting information for the implementation of the 93 km (50 NM), 42.6 km (23 NM) and 27.8 km (15 NM) lateral separation minima is contained in Circular 349. Guidelines for the Implementation of Lateral Separation Minima.

5.4.1.2.1.9. *Transitioning into airspace where a greater lateral separation minimum applies.* Lateral separation will exist when aircraft are established on specified tracks which:

- a. are separated by an appropriate minimum; and
- b. diverge by at least 15 degrees until the applicable lateral separation minimum is established;

providing that it is possible to ensure, by means approved by the appropriate ATS authority, that aircraft have the navigation capability necessary to ensure accurate track guidance.

Figure 5-6. Lateral separation points (see 5.4.1.2.1.7)

5.4.2 Longitudinal separation

5.4.2.1 LONGITUDINAL SEPARATION APPLICATION

5.4.2.1.1 Longitudinal separation shall be applied so that the spacing between the estimated positions of the aircraft being separated is never less than a prescribed minimum. Longitudinal separation between aircraft following the same or diverging tracks may be maintained by application of speed control.

5.4.2.1.2 In applying a time- or distance-based longitudinal separation minimum between aircraft following the same track, care shall be exercised to ensure that the separation minimum will not be infringed whenever the following aircraft is maintaining a higher airspeed than the preceding aircraft. When aircraft are expected to reach minimum separation, speed control shall be applied to ensure that the required separation minimum is maintained.

5.4.2.1.3 Longitudinal separation may be established by requiring aircraft to depart at a specified time, to arrive over a geographical location at a specified time, or to hold over a geographical location until a specified time.

5.4.2.1.4 For the purpose of application of longitudinal separation, the terms *same track*, *reciprocal tracks* and *crossing tracks* shall have the following meanings:

a. Same track (see Figure 5-12):

same direction tracks and intersecting tracks or portions thereof, the angular difference of which is less than 45 degrees or more than 315 degrees, and whose protected airspaces overlap.

b. Reciprocal tracks (see Figure 5-13):

opposite tracks and intersecting tracks or portions thereof, the angular difference of which is more than 135 degrees but less than 225 degrees, and whose protected airspaces overlap.

c. Crossing tracks (see Figure 5-14):

intersecting tracks or portions thereof other than those specified in a) and b) above.

Figure 5-12. Aircraft on same track

Figure 5-13. Aircraft on reciprocal tracks**Figure 5-14. Aircraft on crossing tracks**

5.4.2.2 LONGITUDINAL SEPARATION MINIMA BASED ON TIME

5.4.2.2.1 AIRCRAFT MAINTAINING THE SAME LEVEL

5.4.2.2.1.1 Aircraft flying on the same track:

- a. 15 minutes (see Figure 5-15); or
- b. 10 minutes, if navigation aids permit frequent determination of position and speed (see Figure 5-16); or
- c. 5 minutes in the following cases, provided that in each case the preceding aircraft is maintaining a true airspeed of 37 km/h (20 kt) or more faster than the succeeding

aircraft (see Figure 5-17):

1. between aircraft that have departed from the same aerodrome;
2. between en-route aircraft that have reported over the same exact significant point;
3. between departing and en-route aircraft after the en-route aircraft has reported over a fix that is so located in relation to the departure point as to ensure that five-minute separation can be established at the point the departing aircraft will join the air route;
or
- d. 3 minutes in the cases listed under c) provided that in each case the preceding aircraft is maintaining a true airspeed of 74 km/h (40 kt) or more faster than the succeeding aircraft (see Figure 5-18).

Fig. 5-15. Fifteen Min. Separation between aircraft on same track and same level

Fig. 5-16. Ten Min. Separation between aircraft on same track and same level

Fig. 5-17. Five Min. Separation between

Fig. 5-18. Three Min. Separation between

aircraft on same track and same level

aircraft on same track and same level

5.4.2.2.1.2 *Aircraft flying on crossing tracks:*

- a. 15 minutes at the point of intersection of the tracks (see Figure 5-19); or
- b. 10 minutes if navigation aids permit frequent determination of position and speed (see Figure 5-20).

Fig. 5-19. Fifteen Min. Separation between aircraft on same track and same level

Fig. 5-20. Ten Min. Separation between aircraft on same track and same level

5.4.2.2.2 *AIRCRAFT CLIMBING OR DESCENDING*

5.4.2.2.2.1 *Aircraft on the same track.* When an aircraft will pass through the level of another aircraft on the same track, the following minimum longitudinal separation shall be provided:

- a. 15 minutes while vertical separation does not exist (see Figures 5-21A and 5-21B); or
- b. 10 minutes while vertical separation does not exist, provided that such separation is authorized only where ground-based navigation aids or GNSS permit frequent determination of position and speed (see Figures 5-22A and 5-22B); or
- c. 5 minutes while vertical separation does not exist, provided that the level change is commenced within 10-minutes of the time the second aircraft has reported over an exact

reporting point (see Figures 5-23A and 5-23B).

Note.— To facilitate application of the procedure where a considerable change of level is involved, a descending aircraft may be cleared to some convenient level above the lower aircraft, or a climbing aircraft to some convenient level below the higher aircraft, to permit a further check on the separation that will be obtained while vertical separation does not exist.

Fig. 5-21A. Fifteen Min. Separation between aircraft climbing and on same track

Fig. 5-21B. Fifteen Min. Separation between aircraft descending and on same track

Fig. 5-22A. Ten Min. Separation between aircraft climbing and on same track

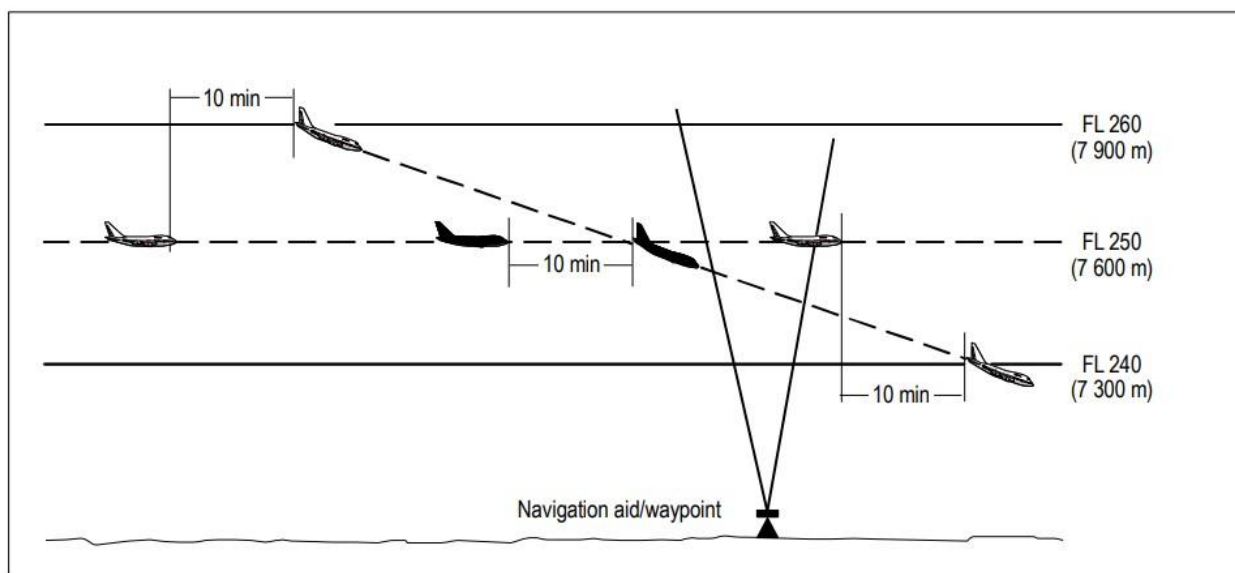

Fig. 5-22B. Ten Min. Separation between aircraft descending and on same track

Fig. 5-23A. Five Min. Separation between aircraft climbing and on same track

Fig. 5-23B. Five Min. Separation between aircraft descending and on same track

5.4.2.2.2 *Aircraft on crossing tracks:*

- a. 15 minutes while vertical separation
- b. n does not exist (see Figures 5-24A and 5-24B); or

Fig. 5-24A. Fifteen Min. Separation between aircraft climbing and crossing tracks

Fig. 5-24A. Fifteen Min. Separation between aircraft descending and crossing tracks

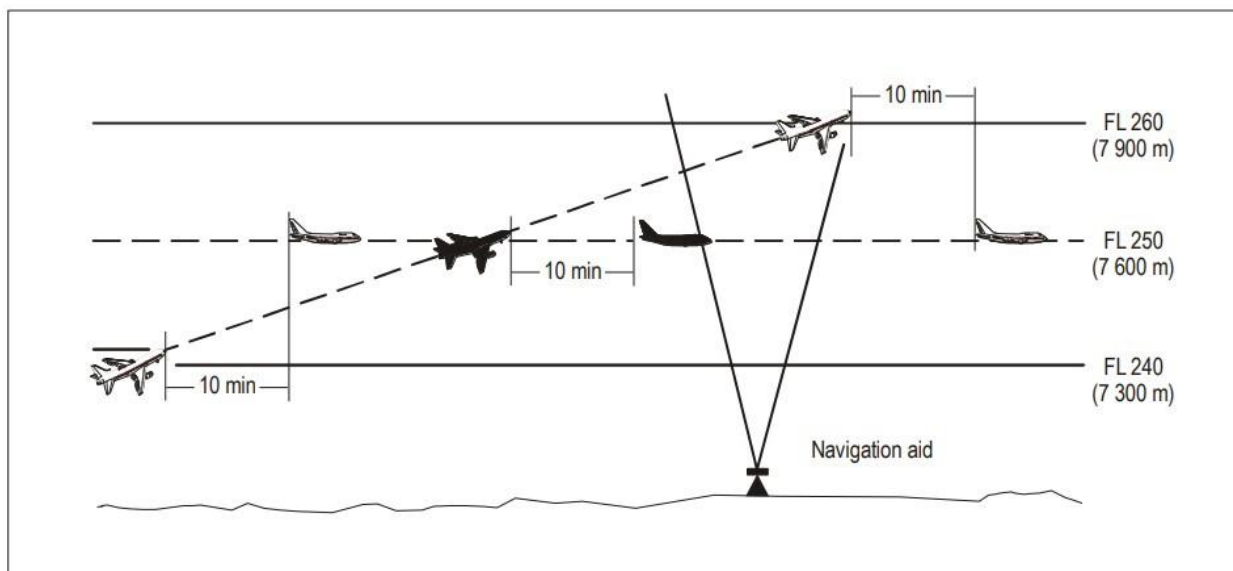

Fig. 5-25A. Ten Min. Separation between aircraft climbing and crossing tracks

Fig. 5-25B. Ten Min. Separation between aircraft descending and crossing tracks

Fig. 5-26. Ten Min. Separation between aircraft on reciprocal tracks

c. 10 minutes while vertical separation does not exist if navigation aids permit frequent determination of position and speed (see Figures 5-25A and 5-25B).

5.4.2.2.2.3 *Aircraft on reciprocal tracks.* Where lateral separation is not provided, vertical separation shall be provided for at least ten minutes prior to and after the time the aircraft are estimated to pass, or are estimated to have passed (see Figure 5-26). Provided it has been determined that the aircraft have passed each other, this minimum need not apply.

5.4.2.3 LONGITUDINAL SEPARATION MINIMA BASED ON DISTANCE USING DISTANCE MEASURING EQUIPMENT (DME) AND/OR GNSS

Note.— Where the term “on track” is used in the provisions relating to the application of longitudinal separation minima using DME and/or GNSS, it means that the aircraft is flying either directly inbound to or directly outbound from the station/waypoint.

5.4.2.3.1 Separation shall be established by maintaining not less than specified distance(s) between aircraft positions as reported by reference to DME in conjunction with other appropriate navigation aids and/or GNSS. This type of separation shall be applied between two aircraft using DME, or two aircraft using GNSS, or one aircraft using DME and one aircraft using GNSS. Direct controller pilot VHF voice communication shall be maintained while such separation is used.

Note.— For the purpose of applying GNSS-based separation minimum, a distance derived from an integrated navigation system incorporating GNSS input is regarded as equivalent to GNSS distance.

5.4.2.3.2 When applying these separation minima between any aircraft with area navigation capability, controllers shall specifically request GNSS-derived distance.

Note.— Reasons making a pilot unable to provide GNSS distance information may include inadequate on-board equipment, no GNSS input into an integrated navigation system, or a loss of GNSS integrity.

5.4.2.3.3 AIRCRAFT AT THE SAME CRUISING LEVEL

5.4.2.3.3.1 Aircraft on the same track:

- a. 37 km (20 NM), provided:
 1. each aircraft utilizes:
 - i. the same “on-track” DME station when both aircraft are utilizing DME; or
 - ii. an “on-track” DME station and a collocated waypoint when one aircraft is utilizing DME and the other is utilizing GNSS; or
 - iii. the same waypoint when both aircraft are utilizing GNSS; and
 2. separation is checked by obtaining simultaneous DME and/or GNSS readings from the aircraft at frequent intervals to ensure that the minimum will not be infringed (see Figure 5-27);
- b. 19 km (10 NM), provided:
 1. the leading aircraft maintains a true airspeed of 37 km/h (20 kt) or more faster than the succeeding aircraft;
 2. each aircraft utilizes:

- i. the same “on-track” DME station when both aircraft are utilizing DME; or
 - ii. an “on-track” DME station and a collocated waypoint when one aircraft is utilizing DME and the other is utilizing GNSS; or
 - iii. the same waypoint when both aircraft are utilizing GNSS; and
3. separation is checked by obtaining simultaneous DME and/or GNSS readings from the aircraft at such intervals as are necessary to ensure that the minimum is established and will not be infringed (see Figure 5-28).

Fig. 5-27. 20 NM DME and/or GNSS-based separation between aircraft on same track and same level

Fig. 5-28. 10 NM DME and/or GNSS-based separation between aircraft on same track and same level

5.4.2.3.3.2 *Aircraft on crossing tracks.* The longitudinal separation prescribed in 5.4.2.3.3.1

shall also apply provided each aircraft reports distance from the DME station and/or collocated waypoint or same waypoint located at the crossing point of the tracks and that the relative angle between the tracks is less than 90 degrees (see Figures 5-29A and 5-29B).

Fig. 5-29A. 20 NM DME and/or GNSS-based separation between aircraft on crossing tracks and same level

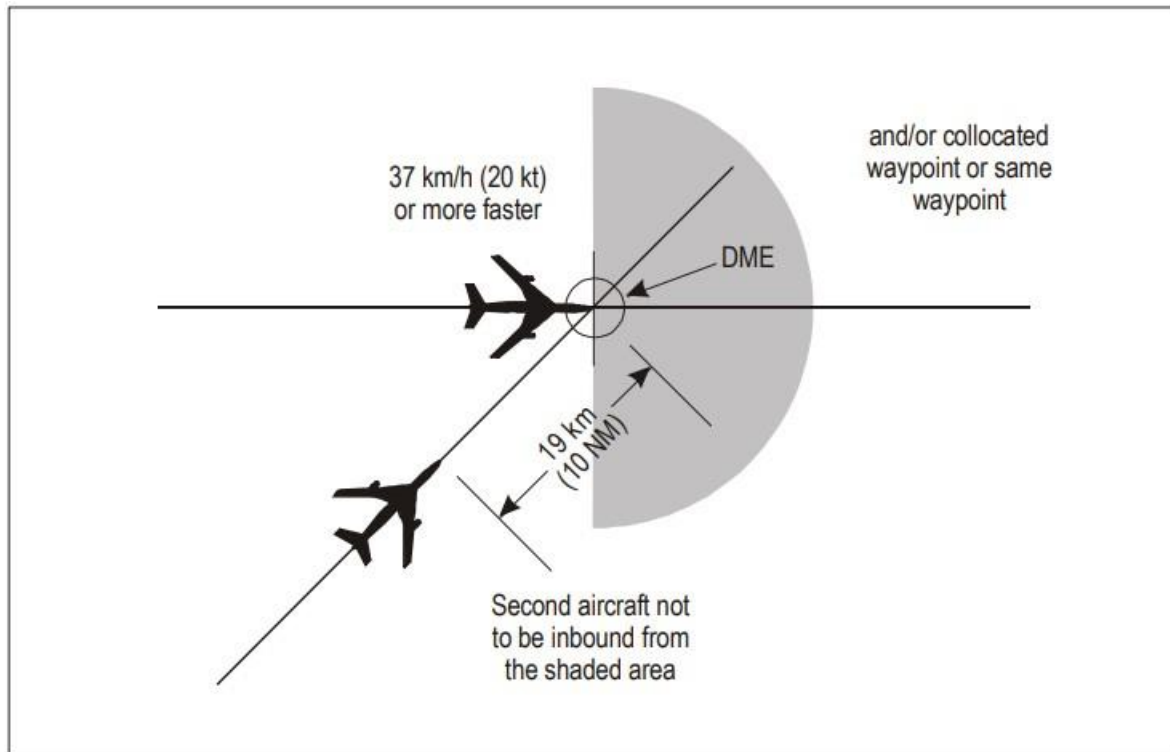

Fig. 5-29B. 10 NM DME and/or GNSS-based separation between aircraft on crossing tracks and same level

5.4.2.3.4 AIRCRAFT CLIMBING AND DESCENDING

5.4.2.3.4.1 *Aircraft on the same track:* 19 km (10 NM) while vertical separation does not exist, provided:

- a. each aircraft utilizes:
 - i. the same “on-track” DME station when both aircraft are utilizing DME; or
 - ii. an “on-track” DME station and a collocated waypoint when one aircraft is utilizing DME and the other is utilizing GNSS; or
 - iii. the same waypoint when both aircraft are utilizing GNSS; and
- b. one aircraft maintains a level while vertical separation does not exist; and
- c. separation is established by obtaining simultaneous DME and/or GNSS readings from the

aircraft (see Figures 5-30A and 5-30B).

Note.— To facilitate application of the procedure where a considerable change of level is involved, a descending aircraft may be cleared to some convenient level above the lower aircraft, or a climbing aircraft to some convenient level below the higher aircraft, to permit a further check on the separation that will be obtained while vertical separation does not exist.

Fig. 5-30A. 10 NM DME and/or GNSS-based separation between aircraft climbing and on same track

Fig. 5-30.B 10 NM DME and/or GNSS-based separation between aircraft descending and on same track

5.4.2.3.4.2 *Aircraft on the reciprocal tracks:* Aircraft utilizing on-track DME and/or collocated waypoint or same waypoint may be cleared to climb or descend to or through the levels occupied by other aircraft utilizing on-track DME and/or collocated waypoint or same waypoint, provided that it has been positively established that the aircraft have passed each other and are at least 10 NM apart, or such other value as prescribed by the appropriate ATS authority.

5.4.2.4 LONGITUDINAL SEPARATION MINIMA BASED ON DISTANCE USING RNAV WHERE RNPIS SPECIFIED

Note.— Guidance material is contained in Attachment B to CAR 11, the Performance-based Navigation (PBN) Manual (Doc 9613), the Air Traffic Services Planning Manual (Doc 9426) and the Manual on Airspace Planning Methodology for the Determination of Separation Minima (Doc 9689).

5.4.2.4.1 Within designated airspace, or on designated routes, separation minima in accordance with the provisions of this section (5.4.2.6) may be used, subject to regional air navigation agreements.

5.4.2.4.2 Separation shall be established by maintaining not less than the specified distance between aircraft positions as reported by reference to the same “on-track” common point, whenever possible ahead of both aircraft, or by means of an automated position reporting system.

Note.— The term “on track” means that the aircraft is flying either directly inbound to or directly outbound from the station or waypoint.

5.4.2.4.2.1 When information is received indicating navigation equipment failure or deterioration below the navigation performance requirements, ATC shall then, as required, apply alternative separation minima.

5.4.2.4.2.2 Direct controller-pilot communications shall be maintained while applying a distance-based separation minima. Direct controller-pilot communications shall be voice or CPDLC. The communication criteria necessary for CPDLC to satisfy the requirement

for direct controller-pilot communications shall be established by an appropriate safety assessment.

Note.— The communication criteria which are used as a basis for the derivation of the separation minima in this section are set out in Appendix 5 of the Manual on Airspace Planning Methodology for the Determination of Separation Minima (Doc 9689). Guidance material for CPDLC is contained in the Manual of Air Traffic Services Data Link Applications (Doc 9694).

5.4.2.4.2.2.1 Prior to and during the application of a distance-based separation minimum, the controller should determine the adequacy of the available communication link, considering the time element required to receive replies from two or more aircraft, and the overall workload/traffic volume associated with the application of such minima.

5.4.2.4.2.3 When aircraft are at, or are expected to reduce to, the minimum separation applicable, speed control techniques, including assigning Mach number, shall be applied to ensure that the minimum distance exists throughout the period of application of the minima.

5.4.2.5. LONGITUDINAL DISTANCE-BASED SEPARATION MINIMA IN AN RNP RNAV ENVIRONMENT NOT USING ADS-C

5.4.2.5.1. For aircraft cruising, climbing or descending on the same track, the following separation minimum may be used:

| <i>Separation minimum</i> | <i>RNP type</i> | <i>Communication requirement</i> | <i>Surveillance requirement</i> | <i>Distance verification requirements</i> | <i>Separation minimum</i> |
|-------------------------------|---------------------|--|-------------------------------------|---|-------------------------------|
| 93 km (50 NM) | 10 | Direct controller-pilot communications | Procedural position reports | At least every 24 minutes | 94 km (50 NM) |

Note 1.— Where a considerable change of level is involved using distance-based separation, a descending aircraft may be cleared to some convenient level above the lower aircraft, or

a climbing aircraft to some convenient level below the higher aircraft (e.g. 1 200 m (4 000 ft) or less) to permit a further check on the separation that will be maintained while vertical separation does not exist.

Note 2.— It should be noted that the separation minimum depicted above is based on safety assessments performed specifically for a particular network of tracks or routes. As such, the assessments evaluated traffic characteristics which might be unique to the network being assessed.

Note 3.— The separation minimum above was developed in accordance with a collision risk analysis which dictates conditions under which this separation can be applied.

Note 4.— Detailed information on the analysis used to determine the separation minimum and on performing safety assessments is contained in the Manual on Airspace Planning Methodology for the Determination of Separation Minima (Doc 9689).

5.4.2.5.2 During the application of the 93 km (50 NM) separation, when an aircraft fails to report its position, the controller shall take action within 3 minutes to establish communication. If communication has not been established within 8 minutes of the time the report should have been received, the controller shall take action to apply an alternative form of separation.

5.4.2.5.3 Where automated position reporting applies, a common time reference shall be used.

5.4.2.5.4 *Aircraft on reciprocal tracks.* Aircraft may be cleared to climb or descend to or through the levels occupied by the other provided that it has been positively established that the aircraft have passed each other and the distance between them is equal to at least the applicable separation minimum.

5.4.2.6. PERFORMANCE-BASED LONGITUDINAL SEPARATION MINIMA

Note.— Guidance material for implementation and application of the separation minima in this section is contained in the Performance-based Communication and Surveillance (PBCS) Manual (Doc 9869), the Global Operational Data Link (GOLD) Manual (Doc 10037), the Satellite Voice Operations Manual (SVOM) (Doc 10038) and the Manual on the Implementation of Performance-based Longitudinal Separation Minima and the Manual on

Monitoring the Application of Performance-Based Horizontal Separation Minima (Doc 10063).

5.4.2.6.1 Within designated airspace, or on designated routes, separation minima in accordance with the provisions of this section may be used.

5.4.2.6.2 The following separation minima may be used for aircraft cruising, climbing or descending on:

- a. the same track; or
- b. crossing tracks, provided that the relative angle between the tracks is less than 90 degrees.

| <i>Separation minima</i> | <i>RNP</i> | <i>RCP</i> | <i>RSP</i> | <i>Maximum ADS-C periodic reporting interval</i> |
|--------------------------|-----------------|------------|------------|--|
| 93 km (50 NM) | 10 | 240 | 180 | 27 minutes |
| | 4 | 240 | 180 | 32 minutes |
| 55.5 km (30 NM) | 2 or 4 | 240 | 180 | 12 minutes |
| 37 km (20 NM) | 2 or 4 | 240 | 180 | 192 seconds (3.2 minutes) |
| 5 minutes | 2 or 4 or 10 | 240 | 180 | 14 minutes |

Note.— The 192 seconds (3.2 minutes) maximum ADS-C periodic reporting interval is intended for use during application of the 37 km (20 NM) separation minimum between specific aircraft pairs and is not intended for use as a default periodic reporting interval for all aircraft. Attention is drawn to the guidance regarding ADS contract – periodic in the Global Operational Data Link (GOLD) Manual (Doc 10037).

5.4.2.6.3 Opposite-direction aircraft on reciprocal tracks may be cleared to climb or descend to or through the levels occupied by another aircraft provided that ADS-C reports show that the aircraft have passed each other by the applicable separation minimum in 5.4.2.9.2.

5.4.2.6.4 The five-minute separation shall be calculated to a resolution of one second without rounding.

5.4.2.6.5 Separation shall be applied so that the distance or time between the calculated positions of the aircraft is never less than the prescribed minimum. This distance or time shall be obtained by one of the following methods:

- a. when the aircraft are on the same identical track, the distance or time may be measured between the calculated positions of the aircraft or may be calculated by measuring the distances or times to a common point on the track (see Figures 5-29 and 5-30);

Note.— Same identical tracks are a special case of same track defined in 5.4.2.1.5 a) where the angular difference is zero degrees or reciprocal tracks defined in 5.4.2.1.5 b) where the angular difference is 180 degrees.

- b. when the aircraft are on the same or reciprocal non-parallel tracks other than in a) above, or on crossing tracks, the distance or time shall be calculated by measuring the distances or times to the common point of intersection of the tracks or projected track (see Figures 5-31 to 5-33); and
- c. when the aircraft are on parallel tracks whose protection areas overlap, the distance or time shall be measured along the track of one of the aircraft as in a) above using its calculated position and the point abeam the calculated position of the other aircraft (see Figure 5-34).

Note.— In all cases presented in Figures 5-29 to 5-34, “d” and “t” are calculated by subtracting the distance or time of the closer aircraft from the common point from the distance or time of the more distant aircraft from the common point, except in Figure 5-33 where the two distances or times are added and the order of the aircraft is not important in the calculation.

5.4.2.6.6 The communication system provided to enable the application of the separation minima in 5.4.2.6.2 shall allow a controller, within 4 minutes, to intervene and resolve a potential conflict by contacting an aircraft using the normal means of communication. An alternative means shall be available to allow the controller to intervene and resolve the conflict within a total time of 10.5 minutes, should the normal means of communication fail.

5.4.2.6.7 When an ADS-C periodic or waypoint change event report is not received within 3 minutes of the time it should have been sent, the report is considered overdue and the controller shall take action to obtain the report as quickly as possible, normally by ADS-C or CPDLC. If a report is not received within 6 minutes of the time the original report should have been sent, and there is a possibility of loss of separation with other aircraft, the controller shall take action to resolve any potential conflict(s) as soon as possible. The communication means provided shall be such that the conflict is resolved within a further 7.5 minutes.

5.4.2.6.8 When information is received indicating ground or aircraft equipment failure or deterioration below the communication, navigation and surveillance performance requirements, ATC shall then, as required, apply alternative separation minima.

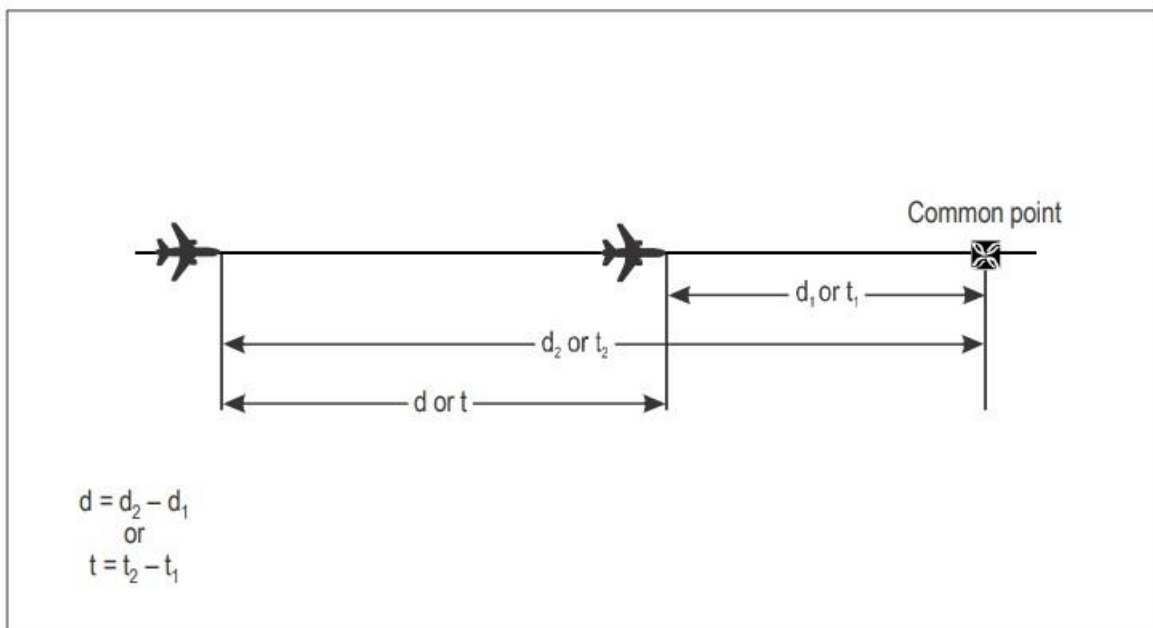

Fig. 5-31. Calculation of longitudinal distance/time between aircraft — identical track, same direction (see 5.4.2.6.5 a))

Fig. 5-32. Calculation of longitudinal distance/time between aircraft — identical track, opposite direction (see 5.4.2.6.5 a))

Fig. 5-35. Calculation of longitudinal distance/time between aircraft — opposite sides of the common point (see 5.4.2.6.5 b))

Figure 5-35. Calculation of longitudinal distance/time between aircraft — parallel tracks (see 5.4.2.6.5 c))

5.5 SEPARATION OF AIRCRAFT HOLDING IN FLIGHT

- 5.5.1** Aircraft established in adjacent holding patterns shall, except when lateral separation between the holding areas exists as determined by the appropriate ATS authority, be separated by the applicable vertical separation minimum.
- 5.5.2** Except when lateral separation exists, vertical separation shall be applied between aircraft holding in flight and other aircraft, whether arriving, departing or en route, whenever the other aircraft concerned are within five minutes flying time of the holding area or within a distance prescribed by the appropriate authority (see Figure 5-36).

5.6 MINIMUM SEPARATION BETWEEN DEPARTING AIRCRAFT

Note.— The following provisions are complementary to the longitudinal separation minima specified in Section 5.4.2.

- 5.6.1** One-minute separation is required if aircraft are to fly on tracks diverging by at least 45 degrees immediately after take-off so that lateral separation is provided (see Figure 5-32).

Note 1.— Wake turbulence categories and groups are contained in Chapter 4, Section 4.9.1 and longitudinal separation minima are contained in Chapter 5, Section 5.8 and in Chapter 8, Section 8.7.3

Note 2.— Detailed characteristics of wake vortices and their effect on aircraft are contained in the Air Traffic Services Planning Manual (Doc 9426), Part II, Section 5.

5.6.2 Two minutes are required between take-offs when the preceding aircraft is 74 km/h (40 kt) or more faster than the following aircraft and both aircraft will follow the same track (see Figure 5-33).

Note.— See Chapter 4, Section 4.6, concerning speed control instructions. Calculations, based on TAS, of speed differentials of aircraft during climb may not be sufficiently accurate in all circumstances for determining if the procedure in 5.6.2 can be applied, in which case calculations based on IAS may be more suitable.

5.6.3 Five-minute separation is required while vertical separation does not exist if a departing aircraft will be flown through the level of a preceding departing aircraft and both aircraft propose to follow the same track (see Figure 5-34). Action must be taken to ensure that the five-minute separation will be maintained or increased while vertical separation does not exist.

Fig. 5-38. One-minute separation between departing aircraft following tracks diverging by at least 45 degrees

Fig. 5-39. Two-minute separation between aircraft following same track

Fig. 5-40. Five-minute separation of departing aircraft following same track

5.7 SEPARATION OF DEPARTING AIRCRAFT FROM ARRIVING AIRCRAFT

5.7.1 Except as otherwise prescribed by the appropriate ATS authority, the following separation shall be applied when take-off clearance is based on the position of an arriving aircraft.

5.7.1.1 If an arriving aircraft is making a complete instrument approach, a departing aircraft may take off:

5.7.1.1.1. in any direction until an arriving aircraft has started its procedure turn or base turn leading to final approach;

5.7.1.1.2. in a direction which is different by at least 45 degrees from the reciprocal of the direction of approach after the arriving aircraft has started procedure turn or base turn leading to final approach, provided that the take-off will be made at least 3 minutes before the arriving aircraft is estimated to be over the beginning of the instrument runway (see Figure 5-35).

5.7.1.2 If an arriving aircraft is making a straight-in approach, a departing aircraft may take off:

5.7.1.2.1. in any direction until 5 minutes before the arriving aircraft is estimated to be over the instrument runway;

5.7.1.2.2. in a direction which is different by at least 45 degrees from the reciprocal of the direction of approach of the arriving aircraft:

1. until 3 minutes before the arriving aircraft is estimated to be over the beginning of the instrument runway (see Figure 5-35); or
2. before the arriving aircraft crosses a designated fix on the approach track; the location of such fix to be determined by the appropriate ANSP after consultation with the operators.

Fig. 5-41. Separation of departing aircraft from arriving aircraft

5.7.1.3 If an arriving aircraft is following an RNAV or RNP instrument flight procedure, a departing aircraft may take off on a departure path that is clear of the arrival protection area for the arriving aircraft (see Figure 5-41) provided:

5.7.1.3.1. vertical separation is applied until the arriving aircraft has reported passing the compulsory reporting waypoint on the instrument flight procedure, the location of such waypoint to be determined by the appropriate ATS authority;

5.7.1.3.2. the take-off takes place before the arriving aircraft crosses a designated

waypoint on the instrument flight procedure, the location of such waypoint to be determined by the appropriate ATS authority; and

5.7.1.3.3. the departing aircraft remains clear of the arrival protection area until another form of separation is established.

Fig. 5-42. Examples of Arrival Protecting Area

5.8 TIME-BASED WAKE TURBULENCE LONGITUDINAL SEPARATION MINIMA

Note.— Distance-based wake turbulence separation minima are set forth in Chapter 8, 8.7.3.4.

5.8.1 Applicability

5.8.1.1 The ATC unit concerned shall not be required to apply wake turbulence separation

5.8.1.1.1. for arriving VFR flights landing on the same runway as a preceding landing SUPER, HEAVY or MEDIUM aircraft; and

5.8.1.1.2. between arriving IFR flights executing visual approach when the aircraft has reported the preceding aircraft in sight and has been instructed to follow and maintain own separation from that aircraft.

5.8.1.2 The ATC unit shall, in respect of the flights specified in 5.8.1.1 a) and b), as well as when otherwise deemed necessary, issue a caution of possible wake turbulence. The pilot-in-command of the aircraft concerned shall be responsible for ensuring that the spacing from a preceding aircraft of a heavier wake turbulence category is acceptable. If it is determined that additional spacing is required, the flight crew shall inform the ATC unit accordingly, stating their requirements.

5.8.2 Arriving aircraft

5.8.2.1 Except as provided for in 5.8.1.1 a) and b), Following minima shall be applied to aircraft landing behind a SUPER, a HEAVY or a MEDIUM aircraft:

5.8.2.1.1. HEAVY aircraft landing behind SUPER aircraft — 2 minutes

5.8.2.1.2. MEDIUM aircraft landing behind SUPER aircraft — 3 minutes

5.8.2.1.3. MEDIUM aircraft landing behind HEAVY aircraft — 2 minutes;

5.8.2.1.4. LIGHT aircraft landing behind SUPER aircraft — 4 minutes

5.8.2.1.5. LIGHT aircraft landing behind a HEAVY or MEDIUM aircraft — 3 minutes.

5.8.3 Departing aircraft

5.8.3.1 When using wake turbulence categories contained in Chapter 4.4.9.1.1 and when the aircraft are using the same runway the following minimum separations shall be applied:

5.8.3.1.1. HEAVY aircraft taking off behind a SUPER aircraft — 2 minutes

5.8.3.1.2. LIGHT aircraft taking off behind a SUPER aircraft — 3 minutes

5.8.3.1.3. LIGHT or MEDIUM aircraft taking off behind a HEAVY aircraft — 2 minutes

5.8.3.1.4. LIGHT aircraft taking off behind a MEDIUM aircraft — 2 minutes

5.8.3.2 When using wake turbulence categories contained in Chapter 4.4.9.1.2 and when the aircraft are using the same runway the following minimum separations shall be applied:

| <i>Preceding aircraft wake turbulence group</i> | <i>Succeeding aircraft wake turbulence group</i> | <i>Time-based wake turbulence separation minima</i> |
|---|--|---|
| A | B | 100 seconds |
| | C | 120 seconds |
| | D | 140 seconds |
| | E | 160 seconds |
| | F | 160 seconds |
| | G | 180 seconds |
| B | D | 100 seconds |
| | E | 120 seconds |
| | F | 120 seconds |
| | G | 140 seconds |
| C | D | 80 seconds |
| | E | 100 seconds |
| | F | 100 seconds |
| | G | 120 seconds |
| D | G | 120 seconds |
| E | G | 100 seconds |

Fig. 5-43. Wake turbulence separation for following aircraft (see 5.8.3.1 and 5.8.3.2)

5.8.3.3 When using wake turbulence categories contained in Chapter 4.4.9.1.1 for aircraft taking off from an intermediate part of the same runway, the following minimum separations

shall be applied:

5.8.3.3.1. HEAVY aircraft taking off behind a SUPER aircraft — 3 minutes

5.8.3.3.2. LIGHT aircraft taking off behind a SUPER aircraft — 4 minutes

5.8.3.3.3. LIGHT or MEDIUM aircraft taking off behind a HEAVY aircraft — 3 minutes

5.8.3.3.4. LIGHT aircraft taking off behind a MEDIUM aircraft — 3 minutes

5.8.3.4 When applying the wake turbulence categories contained in Chapter 4.4.9.1.2 for aircraft taking off from the intermediate part of the same runway, the following minimum separations shall be applied:

| <i>Preceding aircraft wake turbulence group</i> | <i>Succeeding aircraft wake turbulence group</i> | <i>Time-based wake turbulence separation minima</i> |
|---|--|---|
| A | B | 160 seconds |
| | C | 180 seconds |
| | D | 200 seconds |
| | E | 220 seconds |
| | F | 220 seconds |
| | G | 240 seconds |
| B | D | 160 seconds |
| | E | 180 seconds |
| | F | 180 seconds |
| | G | 200 seconds |
| C | D | 140 seconds |
| | E | 160 seconds |
| | F | 160 seconds |
| | G | 180 seconds |
| D | G | 180 seconds |
| E | G | 160 seconds |

Fig. 5-38. Wake turbulence separation for following aircraft (see 5.8.3.3 and 5.8.3.4)

5.8.4 Displaced landing threshold

5.8.4.1 When using wake turbulence categories contained in Chapter 4, 4.9.1.1 and when operating a displaced landing threshold, the following minimum separations shall be applied if the projected flight paths are expected to cross:

- a. a departing HEAVY aircraft following a SUPER aircraft arrival — 2 minutes;
- b. a departing LIGHT or MEDIUM aircraft following a SUPER aircraft arrival — 3 minutes;
- c. a departing LIGHT or MEDIUM aircraft following a HEAVY aircraft arrival — 2 minutes;
- d. a departing LIGHT aircraft following a MEDIUM aircraft arrival — 2 minutes;
- e. a HEAVY aircraft arrival following a SUPER aircraft departure — 2 minutes;
- f. a LIGHT or MEDIUM aircraft arrival following a SUPER aircraft departure— 3 minutes;
- g. a LIGHT or MEDIUM aircraft arrival following a HEAVY aircraft departure — 2 minutes;
- h. a LIGHT aircraft arrival following a MEDIUM aircraft departure — 2 minutes.

5.8.4.2 When using wake turbulence groups contained in Chapter 4, 4.9.1.2 and when operating a displaced landing threshold, the following minimum separations shall be applied when a departing aircraft follows an arriving aircraft, if the projected flight paths are expected to

cross:

| <i>Preceding aircraft wake turbulence group</i> | <i>Succeeding aircraft wake turbulence group</i> | <i>Time-based wake turbulence separation minima</i> |
|---|--|---|
| A | B | 100 seconds |
| | C | 120 seconds |
| | D | 140 seconds |
| | E | 160 seconds |
| | F | 160 seconds |
| | G | 180 seconds |
| B | D | 100 seconds |
| | E | 120 seconds |
| | F | 120 seconds |
| | G | 140 seconds |
| C | D | 80 seconds |
| | E | 100 seconds |
| | R | 100 seconds |
| | G | 120 seconds |
| D | G | 120 seconds |
| E | G | 100 seconds |

5.8.4.3 When using wake turbulence groups contained in Chapter 4, 4.9.1.2 and when operating a displaced landing threshold, the following minimum separations shall be applied when an arriving aircraft follows a departing aircraft, if their projected flight paths are expected to cross:

| <i>Preceding aircraft wake turbulence group</i> | <i>Succeeding aircraft wake turbulence group</i> | <i>Time-based wake turbulence separation minima</i> |
|---|--|---|
| A | B | 100 seconds |
| | C | 120 seconds |
| | D | 140 seconds |
| | E | 160 seconds |
| | F | 160 seconds |
| | G | 180 seconds |
| B | D | 100 seconds |
| | E | 120 seconds |

| | | |
|---|---|-------------|
| | F | 120 seconds |
| | G | 140 seconds |
| C | D | 80 seconds |
| | E | 100 seconds |
| | F | 100 seconds |
| | G | 120 seconds |
| D | G | 120 seconds |
| E | G | 100 seconds |

5.8.5 Opposite direction

5.8.5.1 When using wake turbulence categories contained in Chapter 4, 4.9.1.1 for a heavier aircraft making a low or missed approach and when the lighter aircraft is:

- using an opposite-direction runway for take-off (see Figure 5-39); or
- landing on the same runway in the opposite direction, (see Figure 5-40);

the following minimum separations shall be used:

- between a HEAVY aircraft and a SUPER aircraft — 3 minutes;
- between a LIGHT or MEDIUM aircraft and a SUPER aircraft — 4 minutes;
- between a LIGHT or MEDIUM aircraft and a HEAVY aircraft — 3 minutes;
- between a LIGHT aircraft and a MEDIUM aircraft — 3 minutes.

5.8.5.2 When applying the wake turbulence groups in Chapter 4, 4.9.1.2 and a heavier aircraft is making a low or missed approach and the lighter aircraft is:

- utilizing an opposite-direction runway for take-off (see Figure 5-39); or
- landing on the same runway in the opposite direction, (see Figure 5-40), the following minimum separations shall be used:

| <i>Preceding aircraft wake turbulence group</i> | <i>Succeeding aircraft wake turbulence group</i> | <i>Time-based wake turbulence separation minima</i> |
|---|--|---|
| A | B | 160 seconds |
| | C | 180 seconds |
| | D | 200 seconds |
| | E | 220 seconds |
| | F | 220 seconds |
| | G | 240 seconds |
| B | D | 160 seconds |
| | E | 180 seconds |
| | F | 180 seconds |
| | G | 200 seconds |
| C | D | 140 seconds |
| | E | 160 seconds |
| | F | 160 seconds |
| | G | 180 seconds |
| D | G | 180 seconds |
| E | G | 160 seconds |

Fig. 5-39. Wake turbulence separation for opposite-direction take off (see 5.8.5.1 a) and 5.8.5.2 a))

Fig. 5-40. Wake turbulence separation for opposite-direction take off (see 5.8.5.1 b) and 5.8.5.2 b))

5.9 CLEARANCES TO FLY MAINTAINING OWN SEPARATION WHILE IN VISUAL METEOROLOGICAL CONDITIONS

Note 1.— As indicated in this Section, the provision of vertical or horizontal separation by an air traffic control unit is not applicable in respect of any specified portion of a flight cleared subject to maintaining own separation and remaining in visual meteorological conditions. It is for the flight so cleared to ensure, for the duration of the clearance, that it is not operated in such proximity to other flights as to create a collision hazard.

Note 2.— It is axiomatic that a VFR flight must remain in visual meteorological conditions at all times. Accordingly, the issuance of a clearance to a VFR flight to fly subject to maintaining own separation and remaining in visual meteorological conditions has no other object than to signify that, for the duration of the clearance, separation from other aircraft by air traffic control is not provided.

Note 3.— The objectives of the air traffic control service as prescribed in CAR 11 do not include prevention of collision with terrain. The procedures prescribed in this document do not relieve pilots of their responsibility to ensure that any clearances issued by air traffic control units are safe in this respect. When an IFR flight is vectored or is given a direct routing which takes the aircraft off an ATS route, the procedures in Chapter 8, 8.6.5.2 apply.

When so requested by an aircraft and provided it is agreed by the pilot of the other aircraft and so

authorized by the appropriate ATS authority, an ATC unit may clear a controlled flight, including departing and arriving flights, operating in airspace Classes D and E in visual meteorological conditions during the hours of daylight to fly subject to maintaining own separation to one other aircraft and remaining in visual meteorological conditions. When a controlled flight is so cleared, the following shall apply:

- a. the clearance shall be for a specified portion of the flight at or below 3 050 m (10 000 ft), during climb or descent and subject to further restrictions as and when prescribed on the basis of regional air navigation agreements;
- b. if there is a possibility that flight under visual meteorological conditions may become impracticable, an IFR flight shall be provided with alternative instructions to be complied with in the event that flight in visual meteorological conditions (VMC) cannot be maintained for the term of the clearance;
- c. the pilot of an IFR flight, on observing that conditions are deteriorating and considering that operation in VMC will become impossible, shall inform ATC before entering instrument meteorological conditions (IMC) and shall proceed in accordance with the alternative instructions given.

Note.— See also 5.10.1.2.

5.10 ESSENTIAL TRAFFIC INFORMATION

5.10.1 General

5.10.1.1 Essential traffic is that controlled traffic to which the provision of separation by ATC is applicable, but which, in relation to a particular controlled flight is not, or will not be, separated from other controlled traffic by the appropriate separation minimum.

Note.— Pursuant to Section 5.2, but subject to certain exceptions stated therein, ATC is required to provide separation between IFR flights in airspace Classes A to E, and between IFR and VFR flights in Classes B and C. ATC is not required to provide separation between VFR flights, except within airspace Class B. Therefore, IFR or VFR flights may constitute essential traffic to IFR traffic, and IFR flights may constitute essential traffic to VFR traffic. However, a VFR flight would not constitute

essential traffic to other VFR flights except within Class B airspace.

5.10.1.2 Essential traffic information shall be given to controlled flights concerned whenever they constitute essential traffic to each other.

Note.— This information will inevitably relate to controlled flights cleared subject to maintaining own separation and remaining in visual meteorological conditions and also whenever the intended separation minimum has been infringed.

5.10.2 Information to be provided Essential traffic information shall include:

- a. direction of flight of aircraft concerned;
- b. type and wake turbulence category (if relevant) of aircraft concerned;
- c. cruising level of aircraft concerned; and
 1. estimated time over the reporting point nearest to where the level will be crossed; or 5-50 Air Traffic Management (PANS-ATM) 10/11//16
 2. relative bearing of the aircraft concerned in terms of the 12-hour clock as well as distance from the conflicting traffic; or
 3. actual or estimated position of the aircraft concerned.

Note 1. — Nothing in Section 5.10 is intended to prevent ATC from imparting to aircraft under its control any other information at its disposal with a view to enhancing air safety in accordance with the objectives of ATS as defined in Chapter 2 of CAR 11.

Note 2.— Wake turbulence category will only be essential traffic information if the aircraft concerned is of a heavier wake turbulence category than the aircraft to which the traffic information is directed.

5.11 REDUCTION IN SEPARATION MINIMA

Note.— See also Chapter 2, ATS Safety Management.

5.11.1 Provided an appropriate safety assessment has shown that an acceptable level of safety will be maintained, and after prior consultation with users, the separation minima detailed in 5.4.1 and 5.4.2 may be reduced in the following circumstances:

5.11.1.1 As determined by the appropriate ATS authority as appropriate:

- a. when special electronic or other aids enable the pilot-in-command of an aircraft to determine accurately the aircraft's position and when adequate communication facilities exist for that position to be transmitted without delay to the appropriate air traffic control unit; or
- b. when, in association with rapid and reliable communication facilities, information of an aircraft's position, derived from an ATS surveillance system, is available to the appropriate air traffic control unit; or
- c. when special electronic or other aids enable the air traffic controller to predict rapidly and accurately the flight paths of aircraft, and adequate facilities exist to verify frequently the actual aircraft positions with the predicted positions; or
- d. when RNAV-equipped aircraft operate within the coverage of electronic aids that provide the necessary updates to maintain navigation accuracy.

5.11.1.2 In accordance with regional air navigation agreements when:

- a. special electronic, area navigation or other aids enable the aircraft to closely adhere to their current flight plans; and
- b. the air traffic situation is such that the conditions in 5.11.1.1 a) regarding communications between pilots and the appropriate ATC unit or units need not necessarily be met to the degree specified therein.

Note.— Attention is drawn to the guidance material contained in the *Air Traffic Services Planning Manual (Doc 9426)* regarding conditions governing the reduction of separation minima and to the *Manual on Airspace Planning Methodology for the Determination of Separation Minima (Doc 9689)*.

CHAPTER 6

SEPARATION IN THE VICINITY OF AERODROMES

6.1 REDUCTION IN SEPARATION MINIMA IN THE VICINITY OF AERODROMES

In addition to the circumstances mentioned in Chapter 5, 5.11.1, the separation minima detailed in Chapter 5, 5.4.1 and 5.4.2, may be reduced in the vicinity of aerodromes if:

- a. adequate separation can be provided by the aerodrome controller when each aircraft is continuously visible to this controller; or
- b. each aircraft is continuously visible to flight crews of the other aircraft concerned and the pilots thereof report that they can maintain their own separation; or
- c. in the case of one aircraft following another, the flight crew of the succeeding aircraft reports that the other aircraft is in sight and separation can be maintained.

6.2 ESSENTIAL LOCAL TRAFFIC

6.2.1 Information on essential local traffic known to the controller shall be transmitted without delay to departing and arriving aircraft concerned.

Note 1.— Essential local traffic in this context consists of any aircraft, vehicle or personnel on or near the runway to be used, or traffic in the take-off and climb-out area or the final approach area, which may constitute a collision hazard to a departing or arriving aircraft.

6.2.1.1 Essential local traffic shall be described so as to be easily identified.

6.3 PROCEDURES FOR DEPARTING AIRCRAFT

6.3.1 General

6.3.1.1 Clearances for departing aircraft shall specify, when necessary for the separation of aircraft, direction of take-off and turn after take-off; heading or track to be made good

before taking up the cleared departure track; level to maintain before continuing climb to assigned level; time, point and/or rate at which a level change shall be made; and any other necessary manoeuvre consistent with safe operation of the aircraft.

6.3.1.2 At aerodromes where standard instrument departures (SIDs) have been established, departing aircraft should normally be cleared to follow the appropriate SID.

6.3.2 Standard clearances for departing aircraft

6.3.2.1 GENERAL

The appropriate ATS authority should, wherever possible, establish standardized procedures for transfer of control between the ATC units concerned, and standard clearances for departing aircraft.

Note.— The provisions applying to standardized procedures for coordination and transfer of control are specified in Chapter 10, Section 10.1.1.

6.3.2.2 COORDINATION

6.3.2.2.1 Where standard clearances for departing aircraft have been agreed to between the units concerned, the aerodrome control tower will normally issue the appropriate standard clearance without prior coordination with or approval from the approach control unit or ACC.

6.3.2.2.2 Prior coordination of clearances should be required only in the event that a variation to the standard clearance or the standardized transfer of control procedures is necessary or desirable for operational reasons.

6.3.2.2.3 Provision shall be made to ensure that the approach control unit at all times is kept informed of the sequence in which aircraft will depart as well as the runway to be used.

6.3.2.2.4 Provision shall be made to display the designators of assigned SIDs to the aerodrome control tower, the approach control unit and/or the ACC as applicable.

6.3.2.3 CONTENTS

Standard clearances for departing aircraft shall contain the following items:

- a. aircraft identification;
- b. clearance limit, normally destination aerodrome;
- c. designator of the assigned SID, if applicable;
- d. cleared level,;
- e. allocated SSR code;
- f. any other necessary instructions or information not contained in the SID description, e.g. instructions relating to change of frequency.

Note 1. — See 6.3.2.4.1 for clearances to aircraft on SID.

Note 2.— The use of a SID designator without a cleared level does not authorize the aircraft to climb on the SID vertical profile.

6.3.2.4 CLEARANCES ON A SID

6.3.2.4.1 Clearances to aircraft on a SID with remaining published level and/or speed restrictions shall indicate if such restrictions are to be followed or are cancelled. The following phraseologies shall be used with the following meanings:

- a. CLIMB VIA SID TO (*level*):
 - i) climb to the cleared level and comply with published level restrictions;
 - ii) follow the lateral profile of the SID; and
 - iii) comply with published speed restrictions or ATC-issued speed control instructions as applicable.
- b. CLIMB VIA SID TO (*level*), CANCEL LEVEL RESTRICTION(S):
 - i) climb to the cleared level, published level restrictions are cancelled;

- ii) follow the lateral profile of the SID; and
 - iii) comply with published speed restrictions or ATC-issued speed control instructions as applicable.
- c. CLIMB VIA SID TO (*level*), CANCEL LEVEL RESTRICTION(S) AT (*point(s)*):
- i) climb to the cleared level, published level restriction(s) at the specified point(s) are cancelled;
 - ii) follow the lateral profile of the SID; and
 - iii) comply with published speed restrictions or ATC-issued speed control instructions as applicable.
- d. CLIMB VIA SID TO (*level*), CANCEL SPEED RESTRICTION(S):
- i) climb to the cleared level and comply with published level restrictions;
 - ii) follow the lateral profile of the SID; and
 - iii) published speed restrictions and ATC-issued speed control instructions are cancelled.
- e. CLIMB VIA SID TO (*level*), CANCEL SPEED RESTRICTION(S) AT (*point(s)*):
- i) climb to the cleared level and comply with published level restrictions;
 - ii) follow the lateral profile of the SID; and
 - iii) published speed restrictions are cancelled at the specified point(s).
- f. CLIMB UNRESTRICTED TO (*level*) or CLIMB TO (*level*), CANCEL LEVEL AND SPEED RESTRICTION(S):
- i) climb to the cleared level, published level restrictions are cancelled;
 - ii) follow the lateral profile of the SID; and

iii) published speed restrictions and ATC-issued speed control instructions are cancelled.

6.3.2.4.2 If there are no remaining published level or speed restrictions on the SID, the phrase CLIMB TO (*level*) should be used.

6.3.2.4.3 When subsequent speed restriction instructions are issued, and if the cleared level is unchanged, the phrase CLIMB VIA SID TO (*level*) should be omitted.

6.3.2.4.4 When a departing aircraft is cleared to proceed direct to a published waypoint on the SID, the speed and level restrictions associated with the bypassed waypoints are cancelled. All remaining published speed and level restrictions shall remain applicable.

6.3.2.4.5 When a departing aircraft is vectored or cleared to proceed to a point that is not on the SID, all the published speed and level restrictions of the SID are cancelled and the controller shall:

- a. reiterate the cleared level;
- b. provide speed and level restrictions as necessary; and
- c. notify the pilot if it is expected that the aircraft will be instructed to subsequently rejoin the SID.

Note.— See also 8.6.5.2 regarding prescribed obstacle clearance.

6.3.2.4.6 ATC instructions to an aircraft to rejoin a SID shall include:

- a. the designator of the SID to be rejoined unless advance notification of rejoin has been provided in accordance with 6.3.2.4.5;
- b. the cleared level in accordance with 6.3.2.4.1; and
- c. the position at which it is expected to rejoin the SID.

Note.— See 12.3.3.1 for phraseology on rejoin instructions.

6.3.2.5 COMMUNICATION FAILURE

6.3.2.5.1 Clearances for departing aircraft may specify a clear level other than that indicated in the filed flight plan for the en-route phase of flight, without a time or geographical limit for the cleared level. Such clearances will normally be used to facilitate the application of tactical control methods by ATC, normally through the use of an ATS surveillance system.

6.3.2.5.2 Where clearances for departing aircraft containing no time or geographical limit for a cleared level action to be taken by an aircraft experiencing air-ground communication failure in the event the aircraft has been radar vectored away from the route specified in its current flight plan should be prescribed on the basis of a regional air navigation agreement and included in the SID description or published in AIPs.

6.3.3 Departure sequence

6.3.3.1 Departing aircraft may be expedited by suggesting a take-off direction which is not into the wind. It is the responsibility of the pilot-in-command of an aircraft to decide between making such a take-off or waiting for take-off in a preferred direction.

6.3.3.2 If departures are delayed, the delayed flights shall normally be cleared in an order based on their estimated time of departure, except that deviation from this order may be made to:

- a. facilitate the maximum number of departures with the least average delay;
- b. accommodate requests by an operator in respect of that operator's flights to the extent practicable.

6.3.3.3 Air traffic control units should, when practicable, advise aircraft operators or their designated representatives when anticipated delays are expected to exceed 30 minutes.

6.4 INFORMATION FOR DEPARTING AIRCRAFT

6.4.1 Meteorological conditions

Information regarding significant changes in the meteorological conditions in the take-off or climb out area, obtained by the unit providing approach control service after a departing aircraft has

established communication with such unit, shall be transmitted to the aircraft without delay, except when it is known that the aircraft already has received the information.

Note.— Significant changes in this context include those relating to surface wind direction or speed, visibility, runway visual range or air temperature (for turbine-engined aircraft), and the occurrence of thunderstorm or cumulonimbus, moderate or severe turbulence, wind shear, hail, moderate or severe icing, severe squall line, freezing precipitation, severe mountain waves, sandstorm, duststorm, blowing snow, tornado or waterspout.

6.4.2 Operational status of visual or non-visual aids

Information regarding changes in the operational status of visual or non-visual aids essential for take-off and climb shall be transmitted without delay to a departing aircraft, except when it is known that the aircraft already has received the information.

6.5 PROCEDURES FOR ARRIVING AIRCRAFT

6.5.1 General

6.5.1.1 When it becomes evident that delays will be encountered by arriving aircraft, operators or designated representatives shall, to the extent practicable, be notified and kept currently informed of any changes in such expected delays.

6.5.1.2 Arriving aircraft may be required to report when leaving or passing a significant point or navigation aid, or when starting procedure turn or base turn, or to provide other information required by the controller, to expedite departing and arriving aircraft.

6.5.1.3 An IFR flight shall not be cleared for an initial approach below the appropriate minimum altitude as specified by the State concerned nor to descend below that altitude unless:

- a. the pilot has reported passing an appropriate point defined by a navigation aid or as a waypoint; or
- b. the pilot reports that the aerodrome is and can be maintained in sight; or
- c. the aircraft is conducting a visual approach; or

- d. the controller has determined the aircraft's position by the use of an ATS surveillance system, and a lower minimum altitude has been specified for use when providing ATS surveillance services.

6.5.1.4 At aerodromes where standard instrument arrivals (STARs) have been established, arriving aircraft should normally be cleared to follow the appropriate STAR. The aircraft shall be informed of the type of approach to expect and runway-in-use as early as possible.

Note.— See Section 6.5.2 concerning Standard arrival clearances.

6.5.1.5 After coordination with the approach control unit, the ACC may clear the first arriving aircraft for approach rather than to a holding fix.

6.5.2 Standard clearances for arriving aircraft

6.5.2.1 GENERAL

The appropriate ATS authority should, wherever possible, establish standardized procedures for transfer of control between the ATC units concerned, and standard clearances for arriving aircraft.

Note.— The provisions applying to standardized procedures for coordination and transfer of control are specified in Chapter 10, Section 10.1.1.

6.5.2.2 COORDINATION

6.5.2.2.1 Where standard clearances for arriving aircraft are in use and, provided no terminal delay is expected, clearance to follow the appropriate STAR will normally be issued by the ACC without prior coordination with or approval from the approach control unit or the aerodrome control tower as applicable.

6.5.2.2.2 Prior coordination of clearances should be required only in the event that a variation to the standard clearance or the standardized transfer of control procedures is necessary or desirable for operational reasons.

6.5.2.2.3 Provision shall be made to ensure that the approach control unit is at all times kept

informed of the sequence of aircraft following the same STAR.

6.5.2.2.4 Provision shall be made to display the designators of assigned STARs to the ACC, the approach control unit and/or the aerodrome control tower, as applicable.

6.5.2.3 CONTENTS

Standard clearances for arriving aircraft shall contain the following items:

- a. aircraft identification;
- b. designator of the assigned STAR; if applicable
- c. runway-in-use, except when part of the STAR description;
|
- d. cleared level; and
- e. any other necessary instructions or information not contained in the STAR description,
e.g. change of communications.

Note 1.— See 6.5.2.4.1 for clearances on a STAR.

Note 2.— The use of a STAR designator without a cleared level does not authorize the aircraft to descend on the STAR vertical profile.

6.5.2.4 CLEARANCES ON A STAR

6.4.2.4.1 Clearances to aircraft on a STAR with remaining published level and/or speed restrictions shall indicate if such restrictions are to be followed or are cancelled. The following phraseologies shall be used with the following meaning:

- a. DESCEND VIA STAR TO (*level*):
 - i. descend to the cleared level and comply with published level restrictions;
 - ii. follow the lateral profile of the STAR; and
 - iii. comply with published speed restrictions or ATC-issued speed control instructions as

applicable.

b. DESCEND VIA STAR TO (*level*), CANCEL LEVEL RESTRICTION(S):

- i. descend to the cleared level, published level restrictions are cancelled;
- ii. follow the lateral profile of the STAR; and
- iii. comply with published speed restrictions or ATC-issued speed control instructions as applicable.

c. DESCEND VIA STAR TO (*level*), CANCEL LEVEL RESTRICTION(S) AT (*point(s)*):

- i. descend to the cleared level, published level restriction(s) at the specified point(s) are cancelled;
- ii. follow the lateral profile of the STAR; and
- iii. comply with published speed restrictions or ATC-issued speed control instructions as applicable.

d. DESCEND VIA STAR TO (*level*), CANCEL SPEED RESTRICTION(S):

- i. descend to the cleared level and comply with published level restrictions;
- ii. follow the lateral profile of the STAR; and
- iii. published speed restrictions and ATC-issued speed control instructions are cancelled.

e. DESCEND VIA STAR TO (*level*), CANCEL SPEED RESTRICTION(S):

- i. descend to the cleared level and comply with published level restrictions;
- ii. follow the lateral profile of the STAR; and
- iii. published speed restrictions are cancelled at the specified point(s).

f. DESCEND UNRESTRICTED TO (*level*) or DESCEND TO (*level*), CANCEL LEVEL

AND SPEED RESTRICTION(S):

- i. descend to the cleared level, published level restrictions are cancelled;
- ii. follow the lateral profile of the STAR; and
- iii. published speed restrictions and ATC-issued speed control instructions are cancelled

6.4.2.4.2 If there are no remaining published level or speed restrictions on the STAR, the phrase DESCEND TO (*level*) should be used.

6.4.2.4.3 When subsequent speed restriction instructions are issued and if the cleared level is unchanged, the phrase DESCEND VIA STAR TO (*level*) should be omitted.

6.4.2.4.4 When an arriving aircraft is cleared to proceed direct to a published waypoint on the STAR, the speed and level restrictions associated with the bypassed waypoints are cancelled. All remaining published speed and level restrictions shall remain applicable.

6.4.2.4.5 When an arriving aircraft is vectored or cleared to proceed to a point that is not on the STAR, all the published speed and level restrictions of the STAR are cancelled and the controller shall:

- a. reiterate the cleared level;
- b. provide speed and level restrictions as necessary and;
- c. notify the pilot if it is expected that the aircraft will be instructed to subsequently rejoin the STAR.

Note.— See 8.6.5.2 regarding prescribed obstacle clearance.

6.4.2.4.6 ATC instructions to an aircraft to rejoin a STAR shall include:

- a. the designator of the STAR to be rejoined, unless advance notification of rejoin has been provided in accordance with 6.5.2.4.5;
- b. the cleared level on rejoining the STAR in accordance with 6.5.2.4.1; and

- c. the position at which it is expected to rejoin the STAR.

Note.— See 12.3.3.2 for phraseology on rejoin instructions

6.5.3 Visual approach

6.5.3.1 Subject to the conditions in 6.5.3.3, clearance for an IFR flight to execute a visual approach may be requested by a flight crew or initiated by the controller. In the latter case, the concurrence of the flight crew shall be required.

6.5.3.2 Controllers shall exercise caution in initiating a visual approach when there is reason to believe that the flight crew concerned is not familiar with the aerodrome and its surrounding terrain. Controllers should also take into consideration the prevailing traffic and meteorological conditions when initiating visual approaches.

6.5.3.3 An IFR flight may be cleared to execute a visual approach provided the pilot can maintain visual reference to the terrain and:

- a. the reported ceiling is at or above the level of the beginning of the initial approach segment for the aircraft so cleared; or
- b. the pilot reports at the level of the beginning of the initial approach segment or at any time during the instrument approach procedure that the meteorological conditions are such that with reasonable assurance a visual approach and landing can be completed.

6.5.3.4 Separation shall be provided between an aircraft cleared to execute a visual approach and other arriving and departing aircraft.

6.5.3.5 For successive visual approaches, separation shall be maintained by the controller until the pilot of a succeeding aircraft reports having the preceding aircraft in sight. The aircraft shall then be instructed to follow and maintain own separation from the preceding aircraft. When both aircraft are of a heavy wake turbulence category, or the preceding aircraft is of a heavier wake turbulence category than the following, and the distance between the aircraft is less than the appropriate wake turbulence minimum, the controller shall issue a caution of possible wake turbulence. The pilot-in-command of

the aircraft concerned shall be responsible for ensuring that the spacing from a preceding aircraft of a heavier wake turbulence category is acceptable. If it is determined that additional spacing is required, the flight crew shall inform the ATC unit accordingly, stating their requirements.

6.5.3.6 Transfer of communications to the aerodrome controller should be effected at such a point or time that information on essential local traffic, if applicable, and clearance to land or alternative instructions can be issued to the aircraft in a timely manner.

6.5.4 Instrument approach

6.5.4.1 The approach control unit shall specify the instrument approach procedure to be used by arriving aircraft. A flight crew may request an alternative procedure and, if circumstances permit, should be cleared accordingly.

6.5.4.2 If a pilot reports or it is clearly apparent to the ATC unit that the pilot is not familiar with an instrument approach procedure, the initial approach level, the point (in minutes from the appropriate reporting point) at which base turn or procedure turn will be started, the level at which the procedure turn shall be carried out and the final approach track shall be specified, except that only the last-mentioned need be specified if the aircraft is to be cleared for a straight-in approach. The frequency(ies) of the navigation aid(s) to be used as well as the missed approach procedure shall also be specified when deemed necessary.

6.5.4.3 If visual reference to terrain is established before completion of the approach procedure, the entire procedure must nevertheless be executed unless the aircraft requests and is cleared for a visual approach.

6.5.5 Holding

6.5.5.1 In the event of extended delays, aircraft should be advised of the anticipated delay as early as possible and, when practicable, be instructed or given the option to reduce speed en route in order to absorb delay.

6.5.5.2 When delay is expected, the ACC shall normally be responsible for clearing aircraft to

the holding fix, and for including holding instructions, and expected approach time or onward clearance time, as applicable, in such clearances. (See Section 6.5.8.)

6.5.5.3 After coordination with the approach control unit, the ACC may clear an arriving aircraft to a visual holding location to hold until further advised by the approach control unit.

6.5.5.4 After coordination with the aerodrome control tower, the approach control unit may clear an arriving aircraft to a visual holding location to hold until further advised by the aerodrome control tower.

6.5.5.5 Holding and holding pattern entry shall be accomplished in accordance with procedures established by the ANSP and published in AIPs. If entry and holding procedures have not been published or if the procedures are not known to a flight crew, the appropriate air traffic control unit shall specify the designator of the location or aid to be used, the inbound track, radial or bearing, direction of turn in the holding pattern as well as the time of the outbound leg or the distances between which to hold.

6.5.5.6 Aircraft should normally be held at a designated holding fix. The required minimum vertical, lateral or longitudinal separation from other aircraft shall be provided. Criteria and procedures for the simultaneous use of adjacent holding patterns shall be prescribed in local instructions.

Note.— See Chapter 5, Section 5.5, concerning separation of aircraft holding in flight.

6.5.5.7 Levels at a holding fix or visual holding location shall as far as practicable be assigned in a manner that will facilitate clearing each aircraft to approach in its proper priority. Normally, the first aircraft to arrive over a holding fix or visual holding location should be at the lowest level, with following aircraft at successively higher levels.

6.5.5.8 When extended holding is anticipated, turbojet aircraft should, when practicable, be permitted to hold at higher levels in order to conserve fuel, while retaining their order in the approach sequence.

6.5.5.9 If an aircraft is unable to comply with the published or cleared holding procedure, alternative instructions shall be issued.

6.5.5.10 For the purpose of maintaining a safe and orderly flow of traffic, an aircraft may be instructed to orbit at its present or at any other position, provided the required obstacle clearance is ensured.

6.5.6 Approach sequence

6.5.6.1 GENERAL

The following procedures shall be applied whenever approaches are in progress.

6.5.6.1.1 The approach sequence shall be established in a manner which will facilitate arrival of the maximum number of aircraft with the least average delay. Priority shall be given to:

- a. an aircraft which anticipates being compelled to land because of factors affecting the safe operation of the aircraft (engine failure, shortage of fuel, etc.);
- b. hospital aircraft or aircraft carrying any sick or seriously injured person requiring urgent medical attention;
- c. aircraft engaged in search and rescue operations; and
- d. other aircraft as may be determined by the appropriate authority.

Note.— An aircraft which has encountered an emergency is handled as outlined in Chapter 15, Section 15.1.

6.5.6.1.2 Succeeding aircraft shall be cleared for approach:

- a. when the preceding aircraft has reported that it is able to complete its approach without encountering instrument meteorological conditions; or
- b. when the preceding aircraft is in communication with and sighted by the aerodrome control tower, and reasonable assurance exists that a normal landing can be accomplished; or
- c. when timed approaches are used, the preceding aircraft has passed the defined point inbound, and reasonable assurance exists that a normal landing can be accomplished;

Note.— See 6.5.6.2.1 concerning timed approach procedures.

- d. when the use of an ATS surveillance system confirms that the required longitudinal spacing between succeeding aircraft has been established.

6.5.6.1.3 In establishing the approach sequence, the need for increased longitudinal spacing between arriving aircraft due to wake turbulence shall be taken into account.

6.5.6.1.4 If the pilot of an aircraft in an approach sequence has indicated an intention to hold for weather improvement, or for other reasons, such action shall be approved. However, when other holding aircraft indicate intention to continue their approach to land, the pilot desiring to hold will be cleared to an adjacent fix for holding awaiting weather change or re-routing. Alternatively, the aircraft should be given a clearance to place it at the top of the approach sequence so that other holding aircraft may be permitted to land. Coordination shall be effected with any adjacent ATC unit or control sector, when required, to avoid conflict with the traffic under the jurisdiction of that unit or sector.

6.5.6.1.5 When establishing the approach sequence, an aircraft which has been authorized to absorb a specified period of notified terminal delay by cruising at a reduced speed en route, should, in so far as practicable, be credited with the time absorbed en route.

6.5.6.2 SEQUENCING AND SPACING OF INSTRUMENT APPROACHES

6.5.6.2.1 TIMED APPROACH PROCEDURES

6.5.6.2.1.1 Subject to approval by the appropriate ATS authority, the following procedure should be utilized as necessary to expedite the approaches of a number of arriving aircraft:

- a. a suitable point on the approach path, which shall be capable of being accurately determined by the pilot, shall be specified, to serve as a checkpoint in timing successive approaches;
- b. aircraft shall be given a time at which to pass the specified point inbound, which time shall be determined with the aim of achieving the desired interval between successive landings on the runway while respecting the applicable separation minima at all

times, including the period of runway occupancy.

6.5.6.2.1.2 The time at which aircraft should pass the specified point shall be determined by the unit providing approach control service and notified to the aircraft sufficiently in advance to permit the pilot to arrange the flight path accordingly.

6.5.6.2.1.3 Each aircraft in the approach sequence shall be cleared to pass the specified point inbound at the previously notified time, or any revision thereof, after the preceding aircraft has reported passing the point inbound.

6.5.6.2.2 *INTERVAL BETWEEN SUCCESSIVE APPROACHES*

In determining the time interval or longitudinal distance to be applied between successive approaching aircraft, the relative speeds between succeeding aircraft, the distance from the specified point to the runway, the need to apply wake turbulence separation, runway occupancy times, the prevailing meteorological conditions as well as any condition which may affect runway occupancy times shall be considered. When an ATS surveillance system is used to establish an approach sequence, the minimum distance to be established between succeeding aircraft shall be specified in local instructions. Local instructions shall additionally specify the circumstances under which any increased longitudinal distance between approaches may be required as well as the minima to be used under such circumstances.

6.5.6.2.3 *INFORMATION ON APPROACH SEQUENCE*

Provision shall be made to ensure that the aerodrome control tower is kept informed of the sequence in which aircraft will be established on final approach for landing.

Note 1.— Guidance material on factors to be taken into account when determining separation for timed approaches is contained in the Air Traffic Services Planning Manual (Doc 9426).

Note 2.— Wake turbulence categories and wake turbulence separation minima are contained in Chapter 4, Section 4.9, Chapter 5, Section 5.8 and Chapter 8, Section 8.7.

Note 3.— Detailed characteristics of wake vortices and their effect on aircraft are contained in

the Air Traffic Services Planning Manual (Doc 9426), Part II, Section

6.5.7 Expected approach time

6.5.6.3 An expected approach time shall be determined for an arriving aircraft that will be subjected to a delay of 10 minutes or more or such other period as has been determined by the appropriate authority. The expected approach time shall be transmitted to the aircraft as soon as practicable, and preferably not later than at the commencement of its initial descent from cruising level. A revised expected approach time shall be transmitted to the aircraft without delay whenever it differs from that previously transmitted by 5 minutes or more, or such lesser period of time as has been established by the ANSP or agreed between the ATS units concerned.

6.5.6.4 An expected approach time shall be transmitted to the aircraft by the most expeditious means whenever it is anticipated that the aircraft will be required to hold for 30 minutes or more.

6.5.6.5 The holding fix to which an expected approach time relates shall be identified together with the expected approach time whenever circumstances are such that this would not otherwise be evident to the pilot.

6.5.8 Onward clearance time

In the event an aircraft is held en route or at a location or aid other than the initial approach fix, the aircraft concerned shall, as soon as practicable, be given an expected onward clearance time from the holding fix. The aircraft shall also be advised if further holding at a subsequent holding fix is expected.

Note.— “Onward clearance time” is the time at which an aircraft can expect to leave the fix at which it is being held.

6.6 INFORMATION FOR ARRIVING AIRCRAFT

6.6.1 As early as practicable after an aircraft has established communication with the unit providing approach control service, the following elements of information, in the order listed,

shall be transmitted to the aircraft, with the exception of such elements which it is known the aircraft has already received:

- a. type of approach and runway-in-use;
- b. meteorological information, as follows:
 - i. surface wind direction and speed, including significant variations;
 - ii. visibility and, when applicable, runway visual range (RVR);
 - iii. present weather;
 - iv. cloud below 1 500 m (5 000 ft) or below the highest minimum sector altitude, whichever is greater; cumulonimbus; if the sky is obscured, vertical visibility when available;
 - v. air temperature;
 - vi. dew point temperature, inclusion determined on the basis of a regional air navigation agreement;
 - vii. altimeter setting(s);
 - viii. any available information on significant meteorological phenomena in the approach area; and
 - ix. trend-type landing forecast, when available

6.6.2 As early as practicable after an aircraft has established communication with the unit providing approach control service, the following elements of information, in the order listed, shall be transmitted to the aircraft, with the exception of such elements which it is known the aircraft has already received:

- a. type of approach and runway-in-use;
- b. meteorological information, as follows:

- i. surface wind direction and speed, including significant variations;
- ii. visibility and, when applicable, runway visual range (RVR);
- iii. present weather;
- iv. cloud below 1 500 m (5 000 ft) or below the highest minimum sector altitude, whichever is greater; cumulonimbus; if the sky is obscured, vertical visibility when available;
- v. air temperature;
- vi. dew point temperature, inclusion determined on the basis of a regional air navigation agreement;
- vii. altimeter setting(s);
- viii. any available information on significant meteorological phenomena in the approach area; and
- ix. trend-type landing forecast, when available.

Note.— The meteorological information listed above is identical to that required in ATIS broadcasts for arriving aircraft as specified in Car 11, 4.3.7 j) to r), and is to be extracted from local meteorological routine and special reports, in accordance with Chapter 11, 11.4.3.2.2 to 11.4.3.2.3.

- c. current runway surface conditions, in case of precipitants or other temporary hazards;
- d. changes in the operational status of visual and non-visual aids essential for approach and landing.

6.6.3 In applying the provisions in 6.7.3.1.1, it should be recognized that information published by NOTAM or disseminated by other means may not have been received by the aircraft prior to departure or during en-route flight.

6.6.4 If it becomes necessary or operationally desirable that an arriving aircraft follow an instrument approach procedure or use a runway other than that initially stated, the flight crew shall be advised without delay.

6.6.5 At the commencement of final approach, the following information shall be transmitted to aircraft:

- a. significant changes in the mean surface wind direction and speed;

Note.— Significant changes are specified in Annex 3, Chapter 4. However, if the controller possesses wind information in the form of components, the significant changes are:

—Mean headwind component: 19 km/h (10 kt)

—Mean tailwind component: 4 km/h (2 kt)

—Mean crosswind component: 9 km/h (5 kt)

- b. the latest information, if any, on wind shear and/or turbulence in the final approach area;
- c. the current visibility representative of the direction of approach and landing or, when provided, the current runway visual range value(s) and the trend.

6.6.6 During final approach, the following information shall be transmitted without delay:

- a. the sudden occurrence of hazards (e.g. unauthorized traffic on the runway);
- b. significant variations in the current surface wind, expressed in terms of minimum and maximum values;
- c. significant changes in runway surface conditions;
- d. changes in the operational status of required visual or non-visual aids;
- e. changes in observed RVR value(s), in accordance with the reported scale in use, or changes in the visibility representative of the direction of approach and landing.

CHAPTER 7

PROCEDURES FOR AERODROME CONTROL SERVICE

Note.— This Chapter also includes procedures for the operation of aeronautical ground lights, see Section 7.15.

7.1 FUNCTIONS OF AERODROME CONTROL TOWERS

7.1.1 General

7.1.1.1 Aerodrome control towers shall issue information and clearances to aircraft under their control to achieve a safe, orderly and expeditious flow of air traffic on and in the vicinity of an aerodrome with the object of preventing collision(s) between:

- a. aircraft flying within the designated area of responsibility of the control tower, including the aerodrome traffic circuits;
- b. aircraft operating on the manoeuvring area;
- c. aircraft landing and taking off;
- d. aircraft and vehicles operating on the manoeuvring area;
- e. aircraft on the manoeuvring area and obstructions on that area.

7.1.1.2 Aerodrome controllers shall maintain a continuous watch on all flight operations on and in the vicinity of an aerodrome as well as vehicles and personnel on the manoeuvring area. Watch shall be maintained by visual observation, augmented when available by an ATS surveillance system. Traffic shall be controlled in accordance with the procedures set forth herein and all applicable traffic rules specified by the ANSP. If there are other aerodromes within a control zone, traffic at all aerodromes within such a zone shall be coordinated so that traffic circuits do not conflict.

Note.— Provisions for the use of an ATS surveillance system in the aerodrome control service are contained in Chapter 8, Section 8.10.

7.1.1.2.1 Visual observation shall be achieved through direct out-of-the-window observation, or through Direct observation utilizing a visual surveillance system which is specifically approved for the purpose by the Appropriate ATS authority.

Note.1— For the purposes of automatic recording of visual surveillance system data, CAR 11, 6.4.1 applies.

7.1.1.3 The functions of an aerodrome control tower may be performed by different control or working positions, such :

- a. aerodrome controller, normally responsible for operations on the runway and aircraft flying within the area of responsibility of the aerodrome control tower;
- b. ground controller, normally responsible for traffic on the manoeuvring area with the exception of runways;
- c. clearance delivery position, normally responsible for delivery of start-up and ATC clearances to departing IFR flights.

7.1.2 Alerting service provided by aerodrome control towers

7.1.2.1 Aerodrome control towers are responsible for alerting the rescue and fire fighting services whenever:

- a. an aircraft accident has occurred on or in the vicinity of the aerodrome; or
- b. information is received that the safety of an aircraft which is or will come under the jurisdiction of the aerodrome control tower may have or has been impaired; or
- c. requested by the flight crew; or
- d. when otherwise deemed necessary or desirable.

7.1.2.2 Procedures concerning the alerting of the rescue and fire fighting services shall be contained in local instructions. Such instructions shall specify the type of information to be provided to the rescue and fire fighting services, including type of aircraft and type

of emergency and, when available, number of persons on board, and any dangerous goods carried on the aircraft.

7.1.2.3 Aircraft which fail to report after having been transferred to an aerodrome control tower, or, having once reported, cease radio contact and in either case fail to land five minutes after the expected landing time, shall be reported to the approach control unit, ACC or flight information centre, or to the rescue coordination centre, in accordance with local instructions.

7.1.3 Information on the operational status of navigation services

ATS units shall be kept currently informed of the operational status of radio navigation services and visual aids essential for take off, departure, approach and landing procedures within their area of responsibility and those radio navigation services and visual aids essential for such movement.

7.1.4 Failure or irregularity of aids and equipment

Aerodrome control towers shall immediately report in accordance with local instructions any failure or irregularity of operation in any equipment, light or other device established at an aerodrome for the guidance of aerodrome traffic and flight crews or required for the provision of air traffic control service.

7.2 SELECTION OF RUNWAY-IN-USE

7.2.1 The term “runway-in-use” shall be used to indicate the runway or runways that, at a particular time, are considered by the aerodrome control tower to be the most suitable for use by the types of aircraft expected to land or take off at the aerodrome.

7.2.2 Normally, an aircraft will land and take off into wind unless safety, the runway configuration, meteorological conditions and available instrument approach procedures or air traffic conditions determine that a different direction is preferable. In selecting the runway-in-use, however, the unit providing aerodrome control service shall take into consideration, besides surface wind speed and direction, other relevant factors such as the aerodrome traffic circuits, the length of runways, and the approach and landing aids available.

- 7.2.3** If the runway- in- use is not considered suitable for the operation involved, the flight crew may request permission to use another runway and, if circumstances permit, should be cleared accordingly.

7.3 INITIAL CALL TO AERODROME CONTROL TOWER

For aircraft being provided with aerodrome control service, the initial call shall contain:

- a. designation of the station being called;
- b. call sign and, for aircraft in the SUPER or HEAVY wake turbulence category, the word “super” or “heavy”;
- c. position; and
- d. additional elements, as required by the ANSP.

Note.— See also Chapter 4, 4.11.3.1, for aircraft in the air, making the first call to the aerodrome tower.

7.4 INFORMATION TO AIRCRAFT BY AERODROME CONTROL TOWERS

7.4.1 Information related to the operation of aircraft

Note.— See Chapter 11, 11.4.3, regarding flight information messages.

START-UP TIME PROCEDURES

When so requested by the pilot prior to engine start, an expected take-off time should be given, unless engine start-up time procedures are employed.

Start-up time procedures should be implemented where necessary to avoid congestion and excessive delays on the manoeuvring area or when warranted by ATFM regulations. Start-up time procedures should be contained in local instructions, and should specify the criteria and conditions for determining when and how start-up times shall be calculated and issued to departing flights.

When an aircraft is subject to ATFM regulations, it should be advised to start up in accordance with its allocated slot time.

When the delay for a departing aircraft is anticipated to be less than a time period specified by the appropriate ATS unit, an aircraft may be cleared to start up at its own discretion.

When the delay for a departing aircraft is anticipated to exceed a time period specified by the appropriate ATS unit, the aerodrome control tower should issue an expected start-up time to an aircraft requesting start-up.

A start-up clearance shall only be withheld under circumstances or conditions specified by the ANSP.

If a start-up clearance is withheld, the flight crew shall be advised of the reason.

7.4.1.2 AERODROME AND METEOROLOGICAL INFORMATION

7.4.1.2.1 Prior to taxiing for take-off, aircraft shall be advised of the following elements of information, in the order listed, with the exception of such elements which it is known the aircraft has already received:

- a. the runway to be used;
- b. the surface wind direction and speed, including significant variations therefrom;
- c. the QNH altimeter setting and, either on a regular basis in accordance with local arrangements or if so requested by the aircraft, the QFE altimeter setting;
- d. the air temperature for the runway to be used, in the case of turbine-engined aircraft;
- e. the visibility representative of the direction of take-off and initial climb, if less than 10 km, or, when applicable, the RVR value(s) for the runway to be used;
- f. the correct time.

7.4.1.2.2 Prior to take-off aircraft shall be advised of:

- a. any significant changes in the surface wind direction and speed, the air temperature, and the

visibility or RVR value(s) given in accordance with 7.4.1.2.1;

- b. significant meteorological conditions in the take-off and climb-out area, except when it is known that the information has already been received by the aircraft.

Note.— Significant meteorological conditions in this context include the occurrence or expected occurrence of cumulonimbus or thunderstorm, moderate or severe turbulence, wind shear, hail, moderate or severe icing, severe squall line, freezing precipitation, severe mountain waves, sandstorm, duststorm, blowing snow, tornado or waterspout in the take-off and climb-out area.

7.4.1.2.3 Prior to entering the traffic circuit or commencing its approach to land, an aircraft shall be provided with the following elements of information, in the order listed, with the exception of such elements which it is known the aircraft has already received:

- a. the runway to be used;
- b. the surface wind direction and speed, including significant variations therefrom;
- c. the QNH altimeter setting and, either on a regular basis in accordance with local arrangements or if so requested by the aircraft, the QFE altimeter setting.

7.4.1.3 AERODROME WEATHER OBSERVATIONS

7.4.1.3.1 The Aerodrome Controller shall be the sole authority responsible for opening or closing an aerodrome to arrivals and departures. Pilots shall be advised of observed weather conditions necessary for the purpose of landing and take-off and of significant weather, i.e. any weather phenomenon which might affect flight visibility or present a hazard to an aircraft.

7.4.1.3.2 Aerodrome controller shall use his own observations for determining whether the prevailing conditions are above or below the minima prescribed for aircraft operations. The aerodrome METAR shall not be used for the purpose of opening or closing an aerodrome to aircraft operations.

7.4.1.3.3 When observing weather conditions, the aerodrome controller may either make his observations over the whole of the visual horizon (general observations) or restrict the area considerations to that enclosing the probable flight path of the aircraft (sector observations). Sector observations may be made in any direction in order to accommodate both fixed and rotary wing operations.

7.4.1.3.4 In the specific cases covered by the following subparagraphs the aerodrome controller shall make either sector or general observations as specified.

7.4.1.3.5 Observations for the purpose of closing the aerodrome and for authorizing a flight shall be sector observations.

7.4.1.3.6 Observations made in response to a request by another unit shall be general observations.

7.4.1.3.7 Weather observation for departure and landing shall include such of the following. Items as are significant to the circumstance:

- a. Wind Velocity.
- b. Altimeter setting.
- c. Temperature.
- d. Dew point subject to its availability.
- e. Low cloud.
- f. Visibility in meters.
- g. Intensity of rain, reported or known wind shear, turbulence, etc.

Note: Final decision on weather analysis, closure and open of aerodrome rests on Supervisor controller on duty.

7.4.1.4 ESSENTIAL LOCAL TRAFFIC INFORMATION

7.4.1.4.1 Information on essential local traffic shall be issued in a timely manner, either directly or through the unit providing approach control service when, in the judgement of the aerodrome controller, such information is necessary in the interests of safety, or when requested by aircraft.

7.4.1.4.2 Essential local traffic shall be considered to consist of any aircraft, vehicle or personnel on or near the manoeuvring area, or traffic operating in the vicinity of the aerodrome, which may constitute a hazard to the aircraft concerned.

7.4.1.4.3 Essential local traffic shall be described so as to be easily identified.

7.4.1.5 RUNWAY INCURSION OR OBSTRUCTED RUNWAY

7.4.1.5.1 In the event the aerodrome controller, after a take-off clearance or a landing clearance has been issued, becomes aware of a runway incursion or the imminent occurrence thereof, or the existence of any obstruction on or in close proximity to the runway likely to impair the safety of an aircraft taking off or landing, appropriate action shall be taken as follows:

- a. cancel the take-off clearance for a departing aircraft;
- b. instruct a landing aircraft to execute a go-around or missed approach;
- c. in all cases inform the aircraft of the runway incursion or obstruction and its location in relation to the runway.

Note.— Animals and flocks of birds may constitute an obstruction with regard to runway operations. In addition, an aborted take-off or a go-around executed after touchdown may expose the aeroplane to the risk of overrunning the runway. Moreover, a low altitude missed approach may expose the aeroplane to the risk of a tail strike. Pilots may, therefore, have to exercise their judgement in accordance with CAR 2, 2.4, concerning the authority of the pilot-in-command of an aircraft.

7.4.1.5.2 Pilots and air traffic controllers shall report any occurrence involving an obstruction on the runway or a runway incursion.

Note 1.— Information regarding runway incursions' reporting forms together with instructions for their completion are contained in the Manual on the Prevention of Runway Incursions (Doc 9870). Attention is drawn to the guidance for analysis, data collection and sharing of data related to runway incursions/incidents (see Chapter 5 of Doc 9870).

Note 2.— The provisions in 7.4.1.4.2 have the objective of supporting the State's safety programme and safety management system (SMS).

7.4.1.6 UNCERTAINTY OF POSITION ON THE MANOEUVRING AREA

7.4.1.6.1 Except as provided for in 7.4.1.5.2, a pilot in doubt as to the position of the aircraft with respect to the manoeuvring area shall immediately:

- a. stop the aircraft; and
- b. simultaneously notify the control tower of the circumstances (including the last known position).

7.4.1.6.2 In those situations where a pilot is in doubt as to the position of the aircraft with respect to the manoeuvring area, but recognizes that the aircraft is on a runway, the pilot shall immediately:

- a. notify the control tower of the circumstances (including the last known position);
- b. if able to locate a nearby suitable taxiway, vacate the runway as expeditiously as possible, unless otherwise instructed by the control tower; and then,
- c. stop the aircraft.

7.4.1.6.3 A vehicle driver in doubt as to the position of the vehicle with respect to the manoeuvring area shall immediately:

- a. notify the control tower of the circumstances (including the last known position);
- b. simultaneously, unless otherwise instructed by the control tower, vacate the landing area, taxiway, or other part of the manoeuvring area, to a safe distance as expeditiously as

possible; and then,

- c. stop the vehicle.

7.4.1.6.4 In the event the aerodrome controller becomes aware of an aircraft or vehicle that is lost or uncertain of its position on the manoeuvring area, appropriate action shall be taken immediately to safeguard operations and assist the aircraft or vehicle concerned to determine its position.

7.4.1.7 WAKE TURBULENCE AND JET BLAST HAZARDS

7.4.1.7.1 Aerodrome controllers shall, when applicable, apply the wake turbulence separation minima specified in Chapter 5, Section 5.8. Whenever the responsibility for wake turbulence avoidance rests with the pilot-in-command, aerodrome controllers shall, to the extent practicable, advise aircraft of the expected occurrence of hazards caused by turbulent wake.

Note.— Occurrence of turbulent wake hazards cannot be accurately predicted and aerodrome controllers cannot assume responsibility for the issuance of advice on such hazards at all times, nor for its accuracy. Information on hazards due to wake vortices is contained in the Air Traffic Services Planning Manual (Doc 9426), Part II, Section 5. Wake turbulence categories of aircraft are specified in Chapter 4, 4.9.1.

7.4.1.7.2 In issuing clearances or instructions, air traffic controllers should take into account the hazards caused by jet blast and propeller slipstream to taxiing aircraft, to aircraft taking off or landing, particularly when intersecting runways are being used, and to vehicles and personnel operating on the aerodrome.

Note.— Jet blast and propeller slipstream can produce localized wind velocities of sufficient strength to cause damage to other aircraft, vehicles and personnel operating within the affected area.

7.4.1.8 ABNORMAL AIRCRAFT CONFIGURATION AND CONDITION

7.4.1.8.1 Whenever an abnormal configuration or condition of an aircraft, including conditions such as landing gear not extended or only partly extended, or unusual smoke

emissions from any part of the aircraft, is observed by or reported to the aerodrome controller, the aircraft concerned shall be advised without delay.

7.4.1.8.2 When requested by the flight crew of a departing aircraft suspecting damage to the aircraft, the departure runway used shall be inspected without delay and the flight crew advised in the most expeditious manner as to whether any aircraft debris or bird or animal remains have been found or not.

7.5 ESSENTIAL INFORMATION ON AERODROME CONDITIONS

Note.— See Chapter 11, 11.4.3.4, regarding messages containing information on aerodrome conditions.

7.5.1 Essential information on aerodrome conditions is information necessary to safety in the operation of aircraft, which pertains to the movement area or any facilities usually associated therewith. For example, construction work on a taxi strip not connected to the runway-in-use would not be essential information to any aircraft except one that might be taxied in the vicinity of the construction work. As another example, if all traffic must be confined to runways, that fact should be considered as essential aerodrome information to any aircraft not familiar with the aerodrome.

7.5.2 Essential information on aerodrome conditions shall include information relating to the following:

- a. construction or maintenance work on, or immediately adjacent to the movement area;
- b. rough or broken surfaces on a runway, a taxiway or an apron, whether marked or not;
- c. water, snow, slush, ice or frost on a runway, a taxiway or an apron
- d. anti-icing or de-icing liquid chemicals or other contaminant on a runway, taxiway or apron
- e. snow banks or drifts adjacent to a runway, a taxiway or an apron;
- f. other temporary hazards, including parked aircraft and birds on the ground or in the air;

- g. failure or irregular operation of part or all of the aerodrome lighting system;
- h. any other pertinent information.

Note.— Up-to-date information on the conditions on aprons may not always be available to the aerodrome control tower. The responsibility of the aerodrome control tower in relation to aprons is, with respect to the provisions of 7.5.1 and 7.5.2, limited to the transmission to aircraft of the information which is provided to it by the authority responsible for the aprons.

7.5.3 Essential information on aerodrome conditions shall be given to every aircraft, except when it is known that the aircraft already has received all or part of the information from other sources.

The information shall be given in sufficient time for the aircraft to make proper use of it, and the hazards shall be identified as distinctly as possible.

Note.— “Other sources” include NOTAM, ATIS broadcasts, and the display of suitable signals.

7.5.4 When a not previously notified condition pertaining to the safe use by aircraft of the manoeuvring area is reported to or observed by the controller, the appropriate aerodrome authority shall be informed and operations on that part of the manoeuvring area terminated until otherwise advised by the appropriate aerodrome authority.

7.6 CONTROL OF AERODROME TRAFFIC

7.6.1 General

As the view from the flight deck of an aircraft is normally restricted, the controller shall ensure that instructions and information which require the flight crew to employ visual detection, recognition and observation are phrased in a clear, concise and complete manner.

7.6.2 Designated positions of aircraft in the aerodrome traffic and taxi circuits

The following positions of aircraft in the traffic and taxi circuits are the positions where aircraft

normally receive aerodrome control tower clearances. Aircraft should be watched closely as they approach these positions so that proper clearances may be issued without delay. Where practicable, all clearances should be issued without waiting for aircraft to initiate the call.

- a. *Position 1.* Aircraft initiates call to taxi for departing flight. Runway-in-use information and taxi clearances given.
- b. *Position 2.* If there is conflicting traffic, the departing aircraft will be held at this position. Engine run-up will, when required, normally be performed here.
- c. *Position 3.* Take-off clearance is issued here, if not practicable at position 2.
- d. *Position 4.* Clearance to land is issued here as practicable.
- e. *Position 5.* Clearance to taxi to apron is issued here.
- f. *Position 6.* Parking information issued here, if necessary.

Note 1.— Arriving aircraft executing an instrument approach procedure will normally enter the traffic circuit on final except when visual manoeuvring to the landing runway is required.

Note 2.— See Figure 7-1.

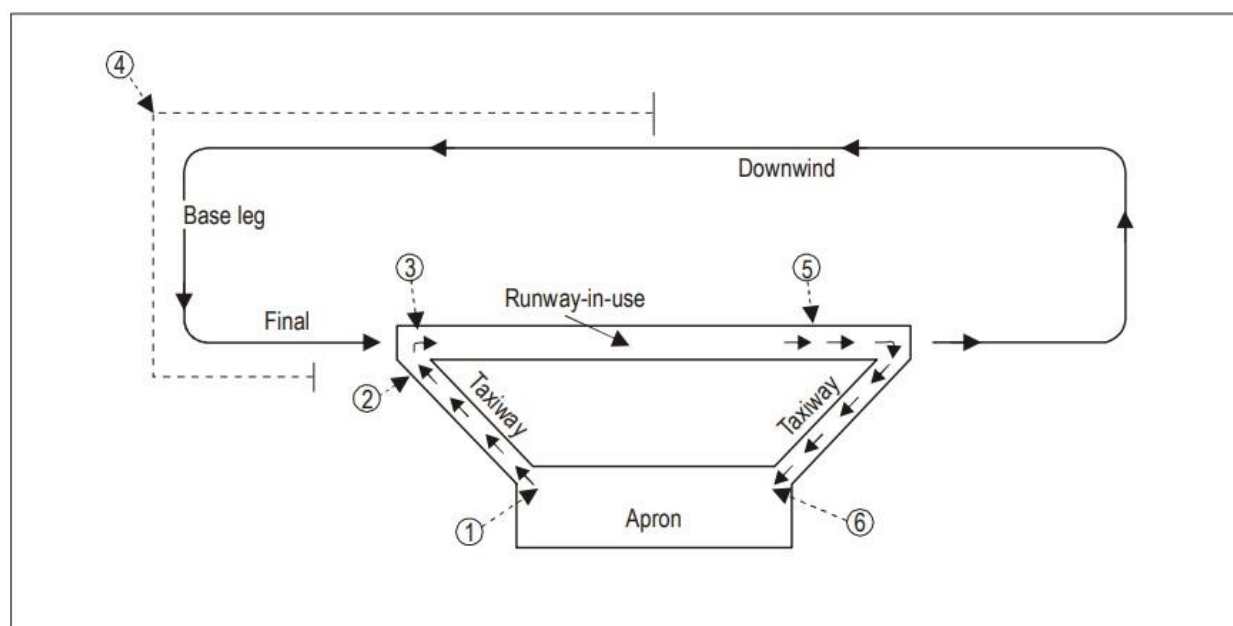

Figure 7-1 Designated positions of aircraft from an aerodrome control tower viewpoint

7.6.3 Traffic on the manoeuvring area

7.6.3.1 CONTROL OF TAXIING AIRCRAFT

7.6.3.1.1 TAXI CLEARANCE

7.6.3.1.1.1 Prior to issuing a taxi clearance, the controller shall determine where the aircraft concerned is parked. Taxi clearances shall contain concise instructions and adequate information so as to assist the flight crew to follow the correct taxi routes, to avoid collision with other aircraft or objects and to minimize the potential for the aircraft inadvertently entering an active runway.

7.6.3.1.1.2 When a taxi clearance contains a taxi limit beyond a runway, it shall contain an explicit clearance to cross or an instruction to hold short of that runway.

7.6.3.1.1.3 Aircraft shall not be permitted to line up and hold on the approach end of a runway-in-use whenever another aircraft is effecting a landing, until the landing aircraft has passed the point of intended holding.

7.6.3.1.1.4 ANSP should whenever practicable publish in the AIP Nepal standard taxi routes to be used at an aerodrome. Standard taxi routes should be identified by appropriate designators and should be used in taxi clearances.

7.6.3.1.1.5 Where standard taxi routes have not been published, a taxi route should, whenever possible, be described by use of taxiway and runway designators. Other relevant information, such as an aircraft to follow or give way to, shall also be provided to a taxiing aircraft.

7.6.3.1.2 *TAXIING ON A RUNWAY-IN-USE*

7.6.3.1.2.1 For the purpose of expediting air traffic, aircraft may be permitted to taxi on the runway-in-use, provided no delay or risk to other aircraft will result. Where control of taxiing aircraft is provided by a ground controller and the control of runway operations by

an aerodrome controller, the use of a runway by taxiing aircraft shall be coordinated with and approved by the aerodrome controller. Communication with the aircraft concerned should be transferred from the ground controller to the aerodrome controller prior to the aircraft entering the runway.

7.6.3.1.2.2 If the control tower is unable to determine, either visually or via an ATS surveillance system that vacating or crossing aircraft has cleared the runway, the aircraft shall be requested to report when it has vacated the runway. The report shall be made when the entire aircraft is beyond the relevant runway-holding position.

7.6.3.1.3 *USE OF RUNWAY-HOLDING POSITIONS*

7.6.3.1.3.1 Except as provided in 7.6.3.1.3.2 or as prescribed by the ANSP, aircraft shall not be held closer to a runway-in-use than at a runway-holding position.

Note.— Runway-holding position locations in relation to runways are specified in Annex 14, Volume I, Chapter 5.

7.6.3.1.3.2 Aircraft shall not be permitted to line up and hold on the approach end of a runway-in-use whenever another aircraft is effecting a landing, until the landing aircraft has passed the point of intended holding.

7.6.3.1.4 *HELICOPTER TAXIING OPERATIONS*

7.6.3.1.4.1 When necessary for a wheeled helicopter or vertical take-off and landing (VTOL) aircraft to taxi on the surface, the following provisions are applicable.

Note.— Ground taxiing uses less fuel than air-taxiing and minimizes air turbulence. However, under certain conditions, such as rough, soft or uneven terrain, it may become necessary to air-taxi for safety considerations. Helicopters with articulating rotors (usually designs with three or more main rotor blades) are subject to “ground resonance” and may, on rare occasions, suddenly lift off the ground to avoid severe damage or destruction.

7.6.3.1.4.2 When it is requested or necessary for a helicopter to proceed at a slow speed above the surface, normally below 37 km/h (20 kt) and in ground effect, air-taxiing may be

authorized.

Note.— Air-taxiing consumes fuel at a high burn rate, and helicopter downwash turbulence (produced in ground effect) increases significantly with larger and heavier helicopters.

7.6.3.1.4.3 Instructions which require small aircraft or helicopters to taxi in close proximity to taxiing helicopters should be avoided and consideration should be given to the effect of turbulence from taxiing helicopters on arriving and departing light aircraft.

7.6.3.1.4.4 A frequency change should not be issued to single-pilot helicopters hovering or air-taxiing. Whenever possible, control instructions from the next ATS unit should be relayed as necessary until the pilot is able to change frequency.

Note.— Most light helicopters are flown by one pilot and require the constant use of both hands and feet to maintain control during low-altitude/low-level flight. Although flight control friction devices assist the pilot, changing frequency near the ground could result in inadvertent ground contact and consequent loss of control.

7.6.3.1.5 LIGHT SIGNALS TO AIRCRAFT

7.6.3.1.5.1 In the case of radiocommunication failure, the signals given below shall have the meaning indicated therein:

7.6.3.2 CONTROL OF OTHER THAN AIRCRAFT TRAFFIC

7.6.3.2.1 ENTRY TO THE MANOEUVRING AREA

The movement of pedestrians or vehicles on the manoeuvring area shall be subject to authorization by the aerodrome control tower. Persons, including drivers of all vehicles, shall be required to obtain authorization from the aerodrome control tower before entry to the manoeuvring area. Notwithstanding such an authorization, entry to a runway or runway strip or change in the operation authorized shall be subject to a further specific authorization by the aerodrome control tower.

7.6.3.2.2 *PRIORITY ON THE MANOEUVRING AREA*

7.6.3.2.2.1 All vehicles and pedestrians shall give way to aircraft which are landing, taxiing or taking off, except that emergency vehicles proceeding to the assistance of an aircraft in distress shall be afforded priority over all other surface movement traffic. In the latter case, all movement of surface traffic should, to the extent practicable, be halted until it is determined that the progress of the emergency vehicles will not be impeded.

7.6.3.2.2.2 When an aircraft is landing or taking off, vehicles shall not be permitted to hold closer to the runway-in-use than:

- a. at a taxiway/runway intersection — at a runway-holding position; and
- b. at a location other than a taxiway/runway intersection — at a distance equal to the separation distance of the runway-holding position.

7.6.3.2.3 *COMMUNICATION REQUIREMENTS AND VISUAL SIGNALS*

7.6.3.2.3.1 At controlled aerodromes all vehicles employed on the manoeuvring area shall be capable of maintaining two-way radiocommunication with the aerodrome control tower, except when the vehicle is only occasionally used on the manoeuvring area and is:

- a. accompanied by a vehicle with the required communications capability; or
- b. employed in accordance with a pre-arranged plan established with the aerodrome control tower.

7.6.3.2.3.2 When communications by a system of visual signals is deemed to be adequate, or in the case of radiocommunication failure, the signals given hereunder shall have the meaning indicated therein:

| <i>Light signal from aerodrome control</i> | <i>Meaning</i> |
|--|---|
| Green flashes | Permission to cross landing area or to move onto taxiway |
| Steady red | Stop |
| Red flashes | Move off the landing area or taxiway and watch out for aircraft |
| White flashes | Vacate manoeuvring area in accordance with local instructions |

7.6.3.2.3.3 When employed in accordance with a plan prearranged with the aerodrome control tower, constructional and maintenance personnel should not normally be required to be capable of maintaining two-way radio communication with the aerodrome control tower.

7.7 CONTROL OF TRAFFIC IN THE TRAFFIC CIRCUIT

7.7.1 General

7.7.1.1 Aircraft in the traffic circuit shall be controlled to provide the separation minima outlined in 7.9.2, 7.10.1 and 7.11 and Chapter 5, Section 5.8, except that:

- a. aircraft in formation are exempted from the separation minima with respect to separation from other aircraft of the same flight;
- b. aircraft operating in different areas or different runways on aerodromes suitable for simultaneous landings or take-offs are exempted from the separation minima;

7.7.1.2 Sufficient separation shall be effected between aircraft in flight in the traffic circuit to allow the spacing of arriving and departing aircraft as outlined in 7.9.2, 7.10.1 and 7.11 and Chapter 5, Section 5.8.

7.7.2 Entry of traffic circuit

7.7.2.1 The clearance to enter the traffic circuit should be issued to an aircraft whenever it is desired that the aircraft approach the landing area in accordance with current traffic circuits but traffic conditions do not yet allow a landing clearance to be issued.

Depending on the circumstances and traffic conditions, an aircraft may be cleared to join at any position in the traffic circuit.

7.7.2.2 An arriving aircraft executing an instrument approach shall normally be cleared to land straight in unless visual manoeuvring to the landing runway is required.

7.7.3 Priority for landing

7.7.3.1 If an aircraft enters an aerodrome traffic circuit without proper authorization, it shall be permitted to land if its actions indicate that it so desires. If circumstances warrant, aircraft which are in contact with the controller may be instructed by the controller to give way so as to remove as soon as possible the hazard introduced by such unauthorized operation. In no case shall permission to land be withheld indefinitely. In contact with the controller may be instructed by the controller to give way so as to remove as soon as possible the hazard introduced by such unauthorized operation. In no case shall permission to land be withheld indefinitely.

7.7.3.2 In cases of emergency it may be necessary, in the interests of safety, for an aircraft to enter a traffic circuit and effect a landing without proper authorization. Controllers should recognize the possibilities of emergency action and render all assistance possible.

7.7.3.3 Priority shall be given to:

- a. an aircraft which anticipates being compelled to land because of factors affecting the safe operation of the aircraft (engine failure, shortage of fuel, etc.);
- b. hospital aircraft or aircraft carrying any sick or seriously injured persons requiring urgent medical attention;
- c. aircraft engaged in search and rescue operations; and
- d. other aircraft as may be determined by ANSP.

Note.— An aircraft which has encountered an emergency is handled as outlined in Chapter 15, Section 15.1.

7.8 ORDER OF PRIORITY FOR ARRIVING AND DEPARTING AIRCRAFT

An aircraft landing or in the final stages of an approach to land shall normally have priority over an aircraft intending to depart from the same or an intersecting runway.

7.9 CONTROL OF DEPARTING AIRCRAFT

7.9.1 Departure sequence

Departures shall normally be cleared in the order in which they are ready for take-off, except that deviations may be made from this order of priority to facilitate the maximum number of departures with the least average delay. Factors which should be considered in relation to the departure sequence include, *inter alia*:

- a. types of aircraft and their relative performance;
- b. routes to be followed after take-off;
- c. any specified minimum departure interval between take-offs;
- d. need to apply wake turbulence separation minima;
- e. aircraft which should be afforded priority; and
- f. aircraft subject to slot requirements.

7.9.2 Separation of departing aircraft

Except as provided in 7.11 and Chapter 5, Section 5.8, a departing aircraft will not normally be permitted to commence take-off until the preceding departing aircraft has crossed the end of the runway-in-use or has started a turn or until all preceding landing aircraft are clear of the runway-in-use.

Note 1.— See Figure 7-3.

Note 2.— Wake turbulence categories and groups are contained in Chapter 4, Section 4.9 and time-based wake turbulence longitudinal separation minima are contained in Chapter 5, Section 5.8. Distance-based wake turbulence separation minima are contained in Chapter 8, Section 8.7.

Note 3.— See 7.6.3.1.2.2.

Fig. 7-2. Separation between departing and arriving aircraft

7.9.3 Take-off clearance

7.9.3.1 Take-off clearance may be issued to an aircraft when there is reasonable assurance that the separation in 7.9.2, or prescribed in accordance with 7.11, will exist when the aircraft commences take-off.

7.9.3.2 When an ATC clearance is required prior to take-off, the take-off clearance shall not be issued until the ATC clearance has been transmitted to and acknowledged by the aircraft concerned. The ATC clearance shall be forwarded to the aerodrome control tower with the least possible delay after receipt of a request made by the tower or prior to such request if practicable.

7.9.3.3 The expression TAKE-OFF shall only be used in radiotelephony when an aircraft is cleared for take-off or when cancelling a take-off clearance.

Note. — The expression TORA, pronounced TOR-AH, may be used to indicate take-off run available.

7.9.3.4 Subject to 7.9.3.2, the take-off clearance shall be issued when the aircraft is ready for take-off and at or approaching the departure runway, and the traffic situation permits. To reduce

the potential for misunderstanding, the take-off clearance shall include the designator of the departure runway.

7.9.3.5 In the interest of expediting traffic, a clearance for immediate take-off may be issued to an aircraft before it enters the runway. On acceptance of such clearance the aircraft shall taxi out to the runway and take off in one continuous movement.

7.10 CONTROL OF ARRIVING AIRCRAFT

7.10.1 Separation of landing aircraft and preceding landing and departing aircraft using the same runway

Except as provided in 7.11 and Chapter 5, Section 5.8, a landing aircraft will not normally be permitted to cross the runway threshold on its final approach until the preceding departing aircraft has crossed the end of the runway-in-use, or has started a turn, or until all preceding landing aircraft are clear of the runway-in-use.

Note 1.— See Figure 7-3.

Note 2.— Wake turbulence categories and groups are contained in Chapter 4, 4.9 and time based wake turbulence longitudinal separation minima are contained in Chapter 5, Section 5.8.

Note 3.— See 7.6.3.1.2.2.

7.10.2 Clearance to land

An aircraft may be cleared to land when there is reasonable assurance that the separation in 7.10.1, or prescribed in accordance with 7.11 will exist when the aircraft crosses the runway threshold, provided that a clearance to land shall not be issued until a preceding landing aircraft has crossed the runway threshold. To reduce the potential for misunderstanding, the landing clearance shall include the designator of the landing runway.

7.10.3 Landing and roll-out manoeuvres

7.10.3.1 When necessary or desirable in order to expedite traffic, a landing aircraft may be requested to:

- a. hold short of an intersecting runway after landing;
- b. land beyond the touchdown zone of the runway;
- c. vacate the runway at a specified exit taxiway;
- d. expedite vacating the runway.

7.10.3.2 In requesting a landing aircraft to perform a specific landing and/or roll-out manoeuvre, the type of aircraft, runway length, location of exit taxiways, reported braking action on runway and taxiway, and prevailing meteorological conditions shall be considered. A SUPER or HEAVY aircraft shall not be requested to land beyond the touchdown zone of a runway.

7.10.3.3 If the pilot-in-command considers that he or she is unable to comply with the requested operation, the controller shall be advised without delay.

7.10.3.4 When necessary or desirable, e.g. due to low visibility conditions, a landing or a taxiing aircraft may be instructed to report when a runway has been vacated. The report shall be made when the entire aircraft is beyond the relevant runway-holding position.

7.11 RUNWAY CLOSURE

7.11.1 If the effect of any conditions (e.g. weather, navigation aids availability, airspace restrictions, etc.) creates the situation where no instrument approach system can be used, then the runway shall be closed for landing requiring instrument approach.

7.11.2 Similarly, when special circumstance exist which in the opinion of the aerodrome controller on duty, would make a landing or take-off hazardous, he/she shall close the runway for landing, take-off or all operations as appropriate.

7.11.3 Except as specified in the Para 7.11.4, the decisions to make a landing or take-off in cross wind or down wind conditions, from a water or slush affected runway or when the presence of birds has been notified, rest solely with the pilot-in-command.

7.11.4 When the runway is closed to aircraft for landing, take-off or all operations, the aerodrome controller shall notify all aircraft which are affected and which are listening on the appropriate

tower frequency including all concerned ATS units.

7.12 USE OF CLOSED RUNWAY IN EMERGENCY

7.12.1 At a closed runway, if a pilot declares an emergency or after advice from the aerodrome controller of any known alternative courses of action, states that it will be safer to land than to adopt alternative action, all assistance shall be afforded to him and the incident shall be reported as an Incident Report.

7.12.2 In the situation as mentioned in 7.12.1 ATC phraseologies that can be used are:

RUNWAY (runway number) CLOSED/UNSAFE. UNABLE TO ISSUE LANDING CLEARANCE. LANDING WILL BE AT YOUR OWN RISK.

7.13 USE OF A VISUAL SURVEILLANCE SYSTEM IN AERODROME CONTROL SERVICE

7.13.1 Capabilities

7.13.1.1 Visual surveillance system used in the provision of aerodrome control services shall have an appropriate level of reliability, availability and integrity. The possibility of system failures or significant system degradations which may cause complete or partial interruptions of service shall be assessed and taken into account in the definition of the level of service provided in order to ensure that there is no degradation in the safety level of the services rendered. Backup facilities or alternative operational procedures shall be provided.

Note— A visual surveillance system will normally consist of a number of integrated elements, including Sensor(s), data transmission links, data processing systems and situation displays.

7.13.1.2 Visual surveillance systems should have the capability to receive, process and display, in an integrated manner, data from all connected resources.

7.13.2 Functions

7.13.1.3 When approved by and subject to conditions prescribed by the appropriate ATS

authority, visual surveillance system may be used in the provision of aerodrome control service to perform the Functions listed in 7.1.

7.13.1.4 The level of service to be provided shall be commensurate with the technical capabilities of the system.

7.14 SUSPENSION OF VISUAL FLIGHT RULES OPERATION

7.14.1 Any or all VFR operations on and in the vicinity of an aerodrome may be suspended by any of the following units, persons or authorities whenever safety requires such action:

- a. the approach control unit or the appropriate ACC;
- b. the aerodrome control tower;
- c. the ATS authority.

7.14.2 All such suspensions of VFR operations shall be accomplished through or notified to the aerodrome control tower.

7.14.3 The following procedures shall be carried by the aerodrome control tower whenever VFR operations are suspended:

- a. hold all VFR departures;
- b. recall all local flights operating under VFR or obtain approval for special VFR operations;
- c. notify the approach control unit or ACC as appropriate of the action taken;
- d. notify all operators, or their designated representatives, of the reason for taking such action, if necessary or requested.

7.15 AUTHORIZATION OF SPECIAL VFR FLIGHTS

7.15.1 When traffic conditions permit, special VFR flights may be authorized subject to the approval of the unit providing approach control service and the provisions of 7.14.1.3.

7.15.1.1 Requests for such authorization shall be handled individually.

7.15.1.2 Separation shall be effected between all IFR flights and special VFR flights in accordance with separation minima in Chapters 5 and 6, and between all special VFR flights in accordance with separation minima prescribed by ANSP.

7.15.1.3 When the ground visibility is not less than 1500 m, special VFR flights may be authorized to: enter a control zone for the purpose of landing, take off and depart from a control zone, cross a control zone or operate locally within a control zone.

Note.1.—ATS provider of concerned airport may establish visibility requirement for the Special VFR that can vary from airport to airport but should not be less than the visibility requirement as mentioned 7.14.1.3. While determining the visibility minima for Special VFR, consideration should be given on the topographical feature and monsoon weather.

Note.2.— Requirements for two-way communications between controlled flights and the appropriate air traffic control unit are contained in CAR 2, 3.6.5.

7.16 AERONAUTICAL GROUND LIGHTS

7.16.1 Operation

Note.— The procedures in this Section apply to all aerodromes, whether or not aerodrome control service is provided. In addition, the procedures in 7.15.2.1 apply to all aeronautical ground lights, whether or not they are on or in the vicinity of an aerodrome.

7.16.2 General

7.16.2.1 All aeronautical ground lights shall be operated, except as provided in 7.15.2.2 and 7.15.3:

- a. continuously during the hours of darkness or during the time the centre of the sun's disc is more than 6 degrees below the horizon, whichever requires the longer period of operation, unless otherwise provided hereafter or otherwise required for the control of air traffic;

- b. at any other time when their use, based on meteorological conditions, is considered desirable for the safety of air traffic.

7.16.2.2 Lights on and in the vicinity of aerodromes that are not intended for en-route navigation purposes may be turned off, subject to further provisions hereafter, if no likelihood of either regular or emergency operation exists, provided that they can be again brought into operation at least one hour before the expected arrival of an aircraft.

7.16.2.3 At aerodromes equipped with lights of variable intensity a table of intensity settings, based on conditions of visibility and ambient light, should be provided for the guidance of air traffic controllers in effecting adjustment of these lights to suit the prevailing conditions. When so requested by an aircraft, further adjustment of the intensity shall be made whenever possible.

7.16.3 Approach lighting

Note.— Approach lighting includes such lights as simple approach lighting systems, precision approach lighting systems, visual approach slope indicator systems, circling guidance lights, approach light beacons and runway alignment indicators.

7.16.3.1 In addition to 7.15.2.1 approach lighting shall also be operated:

- a. by day when requested by an approaching aircraft;
- b. the associated runway lighting is operated.

7.16.3.2 The lights of a visual approach slope indicator system shall be operated during the hours of daylight as well as of darkness and irrespective of the visibility conditions when the associated runway is being used.

7.16.4 Runway lighting

Note.— Runway lighting includes such lights as edge, threshold, centre line, end, touchdown zone and wing bar lights.

7.16.4.1 Runway lighting shall not be operated if that runway is not in use for landing, take-off or

taxiing purposes, unless required for runway inspections or maintenance.

7.16.4.2 If runway lighting is not operated continuously, lighting following a take-off shall be provided as specified below:

- a. at aerodromes where air traffic control service is provided and where lights are centrally controlled, the lights of one runway shall remain lighted after take-off as long as is considered necessary for the return of the aircraft due to an emergency occurring during or immediately after take-off;
- b. at aerodromes without air traffic control service or without centrally controlled lights, the lights of one runway shall remain lighted until such time as would normally be required to reactivate the lights in the likelihood of the departing aircraft returning for an emergency landing, and in any case not less than fifteen minutes after take-off.

Note.— Where obstacle lighting is operated simultaneously with runway lighting as provided in 7.16.8.1, particular care should be taken to ensure that it is not turned off until no longer required by the aircraft.

7.16.5 Stopway lighting

Stopway lights shall be operated whenever the associated runway lights are operated.

7.16.6 Taxiway lighting

Note.— Taxiway lighting includes such lights as edge lights, centre line lights, stop bars and clearance bars.

Where required to provide taxi guidance, taxiway lighting shall be turned on in such order that a continuous indication of the taxi path is presented to taxiing aircraft. Taxiway lighting or any portion thereof may be turned off when no longer needed.

7.16.7 Stop bars

Stop bars shall be switched on to indicate that all traffic shall stop and switched off to indicate that traffic may proceed.

Note.— Stop bars are located across taxiways at the point where it is desired that traffic stop, and consist of lights, showing red, spaced across the taxiway.

7.16.8 Obstacle lighting

Note.— Obstacle lighting includes such lights as obstacle and unserviceability lights and hazard beacons.

7.16.8.1 Obstacle lighting associated with the approach to or departure from a runway or channel, where the obstacle does not project through the inner horizontal surface, as described in CAR 14, Volume I, Chapter 6, may be turned off and on simultaneously with the runway or channel lights.

7.16.8.2 Unserviceability lights may not be turned off as permitted under 7.15.2.2 while the aerodrome is open.

7.16.9 Monitoring of visual aids

7.16.9.1 Aerodrome controllers shall make use of automatic monitoring facilities, when provided, to ascertain whether the lighting is in good order and functioning according to selection.

7.16.9.2 In the absence of an automatic monitoring system or to supplement such a system, the aerodrome controller shall visually observe such lighting as can be seen from the aerodrome control tower and use information from other sources such as visual inspections or reports from aircraft to maintain awareness of the operational status of the visual aids.

7.16.9.3 On receipt of information indicating a lighting fault, the aerodrome controller shall take such action as is warranted to safeguard any affected aircraft or vehicles, and initiate action to have the fault rectified.

7.17 DESIGNATION OF HOT SPOT(S)

The aerodrome operator shall designate, whenever necessary, a location or several locations on the movement area of the aerodrome as hot spot(s).

Note.— Guidance material related to hot spots is contained in the Manual on the Prevention of Runway Incursions (Doc 9870).

CHAPTER 8

ATS SURVEILLANCE SERVICES

8.1 ATS SURVEILLANCE SYSTEMS CAPABILITIES

8.1.1 ATS surveillance systems used in the provision of air traffic services shall have a very high level of reliability, availability and integrity. The possibility of system failures or significant system degradations which may cause complete or partial interruptions of service shall be very remote. Backup facilities shall be provided.

Note 1.— An ATS surveillance system will normally consist of a number of integrated elements, including sensor(s), data transmission links, data-processing systems and situation displays.

Note 2.— Guidance material pertaining to use of radar and to system performance is contained in the Manual on Testing of Radio Navigation Aids (Doc 8071), the Manual on the Secondary Surveillance Radar (SSR) Systems (Doc 9684) and the Air Traffic Services Planning Manual (Doc 9426).

Note 3.— Guidance material pertaining to use of ADS-B and MLAT systems and their system performance is contained in ICAO Cir 326.

Note 4.— Functional and performance requirements pertaining to ATS surveillance systems are contained in Annex 10 — Aeronautical Telecommunications, Volume IV — Surveillance and Collision Avoidance Systems.

8.1.2 ATS surveillance systems should have the capability to receive, process and display, in an integrated manner, data from all the connected sources.

8.1.3 ATS surveillance systems should be capable of integration with other automated systems used in the provision of ATS, and should provide for an appropriate level of automation with the objectives of improving the accuracy and timeliness of data displayed to the controller and reducing controller workload and the need for verbal coordination between adjacent control positions and ATC units.

8.1.4 ATS surveillance systems should provide for the display of safety-related alerts and warnings,

including conflict alert, minimum safe altitude warning, conflict prediction and unintentionally duplicated SSR codes and aircraft identification.

8.1.5 ANSP should, to the extent possible, facilitate the sharing of information derived from ATS surveillance systems in order to extend and improve surveillance coverage in adjacent control areas.

8.1.6 ANSP should, to the extent possible, provide for the automated exchange of coordination data relevant to aircraft being provided with ATS surveillance services, and establish automated coordination procedures.

8.1.7 ATS surveillance systems, such as primary surveillance radar (PSR), secondary surveillance radar (SSR), ADS-B and MLAT systems may be used either alone or in combination in the provision of air traffic services, including in the provision of separation between aircraft, provided:

- a. reliable coverage exists in the area;
- b. the probability of detection, the accuracy and the integrity of the ATS surveillance system(s) are satisfactory; and
- c. in the case of ADS-B, the availability of data from participating aircraft is adequate.

8.1.8 PSR systems should be used in circumstances where other ATS surveillance systems alone would not meet the air traffic services requirements.

8.1.9 SSR systems, especially those utilizing monopulse techniques or having Mode S capability or MLAT, may be used alone, including in the provision of separation between aircraft, provided:

- a. the carriage of SSR transponders is mandatory within the area; and
- b. identification is established and maintained.

8.1.10 ADS-B shall only be used for the provision of air traffic control service provided the quality of

the information contained in the ADS-B message exceeds the values specified by the appropriate ATS authority.

8.1.11 ADS-B may be used alone, including in the provision of separation between aircraft, provided:

- a. identification of ADS-B-equipped aircraft is established and maintained;
- b. the data integrity measure in the ADS-B message is adequate to support the separation minimum;
- c. there is no requirement for detection of aircraft not transmitting ADS-B; and
- d. there is no requirement for determination of aircraft position independent of the position-determining elements of the aircraft navigation system.

8.1.12 The provision of ATS surveillance services shall be limited to specified areas of coverage and shall be subject to such other limitations as have been specified ANSP. Adequate information on the operating methods used shall be published in aeronautical information publications, as well as operating practices and/or equipment limitations having direct effects on the operation of the air traffic services.

Note.— States will provide information on the area where PSR, SSR, ADS-B and MLAT systems are in the use as well as ATS surveillance services and procedures in accordance with PANS-AIM, Appendix 3.

8.1.12.1 The provision of ATS surveillance services shall be limited when position data quality degrades below a level specified by ANSP.

8.1.13 Where PSR and SSR are required to be used in combination, SSR alone may be used in the event of PSR failure to provide separation between identified transponder-equipped aircraft, provided the accuracy of the SSR position indications has been verified by monitor equipment or other means.

8.2 SITUATION DISPLAY

8.2.1 A situation display providing surveillance information to the controller shall, as a minimum,

include position indications, map information required to provide ATS surveillance services and, where available, information concerning the identity of the aircraft and the aircraft level.

8.2.2 The ATS surveillance system shall provide for a continuously updated presentation of surveillance information, including position indications.

8.2.3 Position indications may be displayed as:

- a. individual position symbols, e.g. PSR, SSR, ADS-B or MLAT symbols, or combined symbols;
- b. PSR blips; and
- c. SSR responses.

8.2.4 When applicable, distinct symbols should be used for presentation of:

- a. unintentionally duplicated SSR codes and/or aircraft identification that are unintentionally duplicated;
- b. predicted positions for a non-updated track; and
- c. plot and track data.

8.2.5 Where surveillance data quality degrades such that services need to be limited, symbology or other means shall be used to provide the controller with an indication of the condition.

8.2.6 Reserved SSR codes, including 7500, 7600 and 7700, operation of IDENT, ADS-B emergency and/or urgency modes, safety-related alerts and warnings as well as information related to automated coordination shall be presented in a clear and distinct manner, providing for ease of recognition.

8.2.7 Labels associated with displayed targets should be used to provide, in alphanumeric form, relevant information derived from the means of surveillance and, where necessary, the flight data processing system.

8.2.8 Labels shall, as a minimum, include information relating to the identity of the aircraft, e.g. SSR

code or aircraft identification and, if available, pressure-altitude-derived level information. This information may be obtained from SSR Mode A, SSR Mode C, SSR Mode S and/or ADS-B.

- 8.2.9** Labels shall be associated with their position indications in a manner precluding erroneous identification by or confusion on the part of the controller. All label information shall be presented in a clear and concise manner.

8.3 COMMUNICATIONS

- 8.3.1** The level of reliability and availability of communications systems shall be such that the possibility of system failures or significant degradations is very remote. Adequate backup facilities shall be provided.

Note.— Guidance material and information pertaining to system reliability and availability are contained in Annex 10, Volume I, and the Air Traffic Services Planning Manual (Doc 9426).

- 8.3.2** Direct pilot-controller communications shall be established prior to the provision of ATS surveillance services, unless special circumstances, such as emergencies, dictate otherwise.

8.4 PROVISION OF ATS SURVEILLANCE SERVICES

- 8.4.1** Information derived from ATS surveillance systems, including safety-related alerts and warnings such as conflict alert and minimum safe altitude warning, should be used to the extent possible in the provision of air traffic control service in order to improve capacity and efficiency as well as to enhance safety.

- 8.4.2** The number of aircraft simultaneously provided with ATS surveillance services shall not exceed that which can safely be handled under the prevailing circumstances, taking into account:

- a. the structural complexity of the control area or sector concerned;
- b. the functions to be performed within the control area or sector concerned;
- c. assessments of controller workloads, taking into account different aircraft capabilities, and sector capacity; and

- d. the degree of technical reliability and availability of the primary and backup communications, navigation and surveillance systems, both in the aircraft and on the ground.

8.5 USE OF SSR TRANSPONDERS AND ADS-B TRANSMITTERS

8.5.1 General

To ensure the safe and efficient use of ATS surveillance services, pilots and controllers shall strictly adhere to published operating procedures and standard radiotelephony phraseology shall be used. The correct setting of transponder codes and/or aircraft identification shall be ensured at all times.

8.5.2 SSR code management

Codes 7700, 7600 and 7500 shall be reserved internationally for use by pilots encountering a state of emergency, radio communication failure or unlawful interference, respectively.

SSR codes are to be allocated and assigned in accordance with the following principles.

Codes should be allocated to States or areas in accordance with regional air navigation agreements, taking into account overlapping radar coverage over adjacent airspaces.

ANSP shall establish a plan and procedures for the allocation of codes to ATS units.

The plan and procedures should be compatible with those practiced in adjacent States.

The allocation of a code should preclude the use of this code for any other function within the area of coverage of the same SSR for a prescribed time period.

To reduce pilot and controller workload and the need for controller/pilot communications, the number of code changes required of the pilot should be kept to the minimum.

Codes shall be assigned to aircraft in accordance with the plan and procedures laid down by the ANSP.

Where there is a need for individual aircraft identification, each aircraft shall be assigned a discrete code which should, whenever possible, be retained throughout the flight.

Except for aircraft in a state of emergency, or during communication failure or unlawful interference situations, and unless otherwise agreed between a transferring and an accepting ATC unit, the transferring unit shall assign Code A 2000 to a controlled flight prior to transfer of communications.

8.5.3 Operation of SSR transponders

Note.— SSR transponder operating procedures are contained in Procedures for Air Navigation Services — Aircraft Operations (PANS-OPS, Doc 8168), Volume I, Part III, Section 3.

When it is observed that the Mode A code shown on the situation display is different to what has been assigned to the aircraft, the pilot shall be requested to confirm the code selected and, if the situation warrants (e.g. not being a case of unlawful interference), to reselect the correct code.

If the discrepancy between assigned and displayed Mode A codes still persists, the pilot may be requested to stop the operation of the aircraft's transponder. The next control position and any other affected unit using SSR and/or MLAT in the provision of ATS shall be informed accordingly.

Aircraft equipped with Mode S having an aircraft identification feature shall transmit the aircraft identification as specified in Item 7 of the ICAO flight plan or, when no flight plan has been filed, the aircraft registration.

Note.— All Mode S-equipped aircraft engaged in international civil aviation are required to have an aircraft identification feature (Annex 10, Volume IV, Chapter 2, 2.1.5.2, refers).

Whenever it is observed on the situation display that the aircraft identification transmitted by a Mode S-equipped aircraft is different from that expected from the aircraft, the pilot shall be requested to confirm and, if necessary, re-enter the correct aircraft identification.

If, following confirmation by the pilot that the correct aircraft identification has been set on the Mode S identification feature, the discrepancy continues to exist, the following actions shall be taken by the controller:

- a. inform the pilot of the persistent discrepancy;
- b. where possible, correct the label showing the aircraft identification on the situation display; and
- c. notify the erroneous aircraft identification transmitted by the aircraft to the next control position and any other interested unit using Mode S for identification purposes.

8.5.4 Operation of ADS-B transmitters

Note 1.— To indicate that it is in a state of emergency or to transmit other urgent information, an aircraft equipped with ADS-B might operate the emergency and/or urgency mode as follows:

- a. emergency;*
- b. communication failure;*
- c. unlawful interference;*
- d. minimum fuel; and/or*
- e. medical.*

Note 2.— Some aircraft equipped with first generation ADS-B avionics do not have the capability described in Note 1 above and only have the capability to transmit a general emergency alert regardless of the code selected by the pilot.

Aircraft equipped with ADS-B having an aircraft identification feature shall transmit the aircraft identification as specified in Item 7 of the ICAO flight plan or, when no flight plan has been filed, the aircraft registration.

Whenever it is observed on the situation display that the aircraft identification transmitted by an ADS-B-equipped aircraft is different from that expected from the aircraft, the pilot shall be requested to confirm and, if necessary, re-enter the correct aircraft identification.

If, following confirmation by the pilot that the correct aircraft identification has been set on the ADS-B identification feature, the discrepancy continues to exist, the following

actions shall be taken by the controller:

- a. inform the pilot of the persistent discrepancy;
- b. where possible, correct the label showing the aircraft identification on the situation display; and
- c. notify the next control position and any other unit concerned of the erroneous aircraft identification transmitted by the aircraft.

8.5.5 Level information based on the use of pressure-altitude information

VERIFICATION OF LEVEL INFORMATION

The tolerance value used to determine that pressure-altitude-derived level information displayed to the controller is accurate shall be ± 60 m (± 200 ft) in RVSM airspace. In other airspace, it shall be ± 90 m (± 300 ft), except that the appropriate ATS authority may specify a smaller criterion, but not less than ± 60 m (± 200 ft), if this is found to be more practical. Geometric height information shall not be used for separation.

Verification of pressure-altitude-derived level information displayed to the controller shall be effected at least once by each suitably equipped ATC unit on initial contact with the aircraft concerned or, if this is not feasible, as soon as possible thereafter. The verification shall be effected by simultaneous comparison with altimeter-derived level information received from the same aircraft by radiotelephony. The pilot of the aircraft whose pressure-altitude-derived level information is within the approved tolerance value need not be advised of such verification. Geometric height information shall not be used to determine if altitude differences exist.

If the displayed level information is not within the approved tolerance value or when a discrepancy in excess of the approved tolerance value is detected subsequent to verification, the pilot shall be advised accordingly and requested to check the pressure setting and confirm the aircraft's level.

If, following confirmation of the correct pressure setting the discrepancy continues to exist, the

following action should be taken according to circumstances:

- a. request the pilot to stop Mode C or ADS-B altitude data transmission, provided this does not cause the loss of position and identity information, and notify the next control positions or ATC unit concerned with the aircraft of the action taken; or
- b. inform the pilot of the discrepancy and request that the relevant operation continue in order to prevent loss of position and identity information of the aircraft and, when authorized by the ANSP, override the label-displayed level information with the reported level. Notify the next control position or ATC unit concerned with the aircraft of the action taken.

DETERMINATION OF LEVEL OCCUPANCY

The criterion which shall be used to determine that a specific level is occupied by an aircraft shall be ± 60 m (± 200 ft) in RVSM airspace. In other airspace, it shall be ± 90 m (± 300 ft), except that ANSP may specify a smaller criterion, but not less than ± 60 m (± 200 ft), if this is found to be more practical.

Note.— For a brief explanation of the considerations underlying this value, see the Air Traffic Services Planning Manual (Doc 9426).

Aircraft maintaining a level. An aircraft is considered to be maintaining its assigned level as long as the pressure-altitude-derived level information indicates that it is within the appropriate tolerances of the assigned level, as specified in 8.5.5.2.1.

Aircraft vacating a level. An aircraft cleared to leave a level is considered to have commenced its manoeuvre and vacated the previously occupied level when the pressure-altitude-derived level information indicates a change of more than 90 m (300 ft) in the anticipated direction from its previously assigned level.

Aircraft passing a level in climb or descent. An aircraft in climb or descent is considered to have crossed a level when the pressure-altitude-derived level information indicates that it has passed this level in the required direction by more than 90 m (300 ft).

Aircraft reaching a level. An aircraft is considered to have reached the level to which it has been cleared when the elapsed time of three display updates, three sensor updates or 15 seconds, whichever is the greater, has passed since the pressure-altitude-derived level information has indicated that it is within the appropriate tolerances of the assigned level, as specified in 8.5.5.2.1.

Intervention by a controller shall only be required if differences in level information between that displayed to the controller and that used for control purposes are in excess of the values stated above.

8.6 GENERAL PROCEDURES

8.6.1 Performance checks

The controller shall adjust the situation display(s) and carry out adequate checks on the accuracy thereof, in accordance with the technical instructions prescribed by the appropriate authority for the equipment concerned.

The controller shall be satisfied that the available functional capabilities of the ATS surveillance system as well as the information presented on the situation display(s) is adequate for the functions to be performed.

The controller shall report, in accordance with local procedures, any fault in the equipment, or any incident requiring investigation, or any circumstances which make it difficult or impractical to provide ATS surveillance services.

8.6.2 Identification of aircraft

8.6.2.1 ESTABLISHMENT OF IDENTIFICATION

Before providing an ATS surveillance service to an aircraft, identification shall be established and the pilot informed. Thereafter, identification shall be maintained until termination of the ATS surveillance service.

If identification is subsequently lost, the pilot shall be informed accordingly and, when

applicable, appropriate instructions issued.

Identification shall be established by at least one of the methods specified in 8.6.2.2, 8.6.2.3, 8.6.2.4 and 8.6.2.5.

8.6.2.2 ADS-B IDENTIFICATION PROCEDURES

Where ADS-B is used for identification, aircraft may be identified by one or more of the following procedures:

- a. direct recognition of the aircraft identification in an ADS-B label;
- b. transfer of ADS-B identification (see 8.6.3); and
- c. observation of compliance with an instruction to TRANSMIT ADS-B IDENT.

Note 1.— Some aircraft equipped with first generation ADS-B avionics do not have the capability of squawking IDENT while the emergency and/or urgency mode is selected.

Note 2.— In automated systems, the “IDENT” feature may be presented in different ways, e.g. as a flashing of all or part of the position indication and associated label.

8.6.2.3 SSR and/or MLAT IDENTIFICATION PROCEDURES

8.6.2.3.1. Where SSR and/or MLAT is used for identification, aircraft may be identified by one or more of the following procedures:

- a. recognition of the aircraft identification in an SSR and/or MLAT label;

Note.—The use of this procedure requires that the code/call sign correlation is achieved successfully, taking into account the Note following b) below.

- b. recognition of an assigned discrete code, the setting of which has been verified, in an SSR and/or MLAT label; and

Note.— The use of this procedure requires a system of code assignment which ensures that each aircraft in a given portion of airspace is assigned a discrete code (see 8.5.2.2.7).

- c. direct recognition of the aircraft identification of a Mode S-equipped aircraft in an SSR and/or MLAT label;

Note.— The aircraft identification feature available in Mode S transponders provides the means to identify directly individual aircraft on situation displays and thus offers the potential to eliminate ultimately the recourse to Mode A discrete codes for individual identification. This elimination will only be achieved in a progressive manner depending on the state of deployment of suitable ground and airborne installations.

- d. by transfer of identification (see 8.6.3);
- e. observation of compliance with an instruction to set a specific code;
- f. observation of compliance with an instruction to squawk IDENT.

Note 1.— In automated radar systems, the “IDENT” feature may be presented in different ways, e.g. as a flashing of all or part of the position indication and associated label.

Note 2.— Garbling of transponder replies may produce “IDENT”-type of indications. Nearly simultaneous “IDENT” transmissions within the same area may give rise to errors in identification.

8.6.2.3.2. When a discrete code has been assigned to an aircraft, a check shall be made at the earliest opportunity to ensure that the code set by the pilot is identical to that assigned for the flight. Only after this check has been made shall the discrete code be used as a basis for identification.

PSR IDENTIFICATION PROCEDURES

Where PSR is used for identification, aircraft may be identified by one or more of the following

procedures:

- a. by correlating a particular radar position indication with an aircraft reporting its position over, or as bearing and distance from, a point shown on the situation display, and by ascertaining that the track of the particular radar position is consistent with the aircraft path or reported heading;

Note 1.— Caution must be exercised when employing this method since a position reported in relation to a point may not coincide precisely with the radar position indication of the aircraft on the situation display. The appropriate ANSP may, therefore, prescribe additional conditions for the application of this method, e.g.:

- i. a level or levels above which this method may not be applied in respect of specified navigation aids; or*
- ii. a distance from the radar site beyond which this method may not be applied.*

Note 2.— The term

“a point” refers to a geographical point suitable for the purposes of identification. It is normally a reporting point defined by reference to a radio navigation aid or aids.

- b. by correlating an observed radar position indication with an aircraft which is known to have just departed, provided that the identification is established within 2 km (1 NM) from the end of the runway used. Particular care should be taken to avoid confusion with aircraft holding over or overflying the aerodrome, or with aircraft departing from or making a missed approach over adjacent runways;
- c. by transfer of identification (see 8.6.3);
- d. by ascertaining the aircraft heading, if circumstances require, and following a period of track observation;

- instructing the pilot to execute one or more changes of heading of 30 degrees or more and correlating the movements of one particular radar position indication with the aircraft's acknowledged execution of the instructions given; or
- correlating the movements of a particular radar position indication with manoeuvres currently executed by an aircraft having so reported.

When using these methods, the controller shall:

- i. verify that the movements of not more than one radar position indication correspond with those of the aircraft; and
- ii. ensure that the manoeuvre(s) will not carry the aircraft outside the coverage of the radar or the situation display.

Note 1.— Caution must be exercised when employing these methods in areas where route changes normally take place.

Note 2.— With reference to ii) above, see also 8.6.5.1 regarding vectoring of controlled aircraft.

Use may be made of direction-finding bearings to assist in identification of an aircraft. This method, however, shall not be used as the sole means of establishing identification, unless so prescribed by the appropriate ATS authority for particular cases under specified conditions.

ADDITIONAL IDENTIFICATION METHOD

When two or more position indications are observed in close proximity, or are observed to be making similar movements at the same time, or when doubt exists as to the identity of a position indication for any other reason, changes of heading should be prescribed or repeated as many times as necessary, or additional methods of identification should be employed, until all risk of error in identification is eliminated.

8.6.3 Transfer of identification

Transfer of identification from one controller to another should only be attempted when it is

considered that the aircraft is within the accepting controller's surveillance coverage.

Transfer of identification shall be effected by one of the following methods:

- a. designation of the position indication by automated means, provided that only one position indication is thereby indicated and there is no possible doubt of correct identification;
- b. notification of the aircraft's discrete SSR code or aircraft address;

Note 1.— The use of a discrete SSR code requires a system of code assignment which ensures that each aircraft in a given portion of airspace is assigned a discrete code (see 8.5.2.2.7).

Note 2.— Aircraft address would be expressed in the form of the alphanumerical code of six hexadecimal characters.

- c. notification that the aircraft is SSR Mode S-equipped with an aircraft identification feature when SSR Mode S coverage is available;
- d. notification that the aircraft is ADS-B-equipped with an aircraft identification feature when compatible ADS-B coverage is available;
- e. direct designation (pointing with the finger) of the position indication, if the two situation displays are adjacent, or if a common "conference" type of situation display is used;

Note.— Attention must be given to any errors which might occur due to parallax effects.

- f. designation of the position indication by reference to, or in terms of bearing and distance from, a geographical position or navigational facility accurately indicated on both situation displays, together with the track of the observed position indication if the route of the aircraft is not known to both controllers;

Note.— Caution must be exercised before transferring identification using this method, particularly if other position indications are observed on similar headings and in close proximity to the aircraft under control. Inherent radar deficiencies, such as inaccuracies in

bearing and distance of the radar position indications displayed on individual situation displays and parallax errors, may cause the indicated position of an aircraft in relation to the known point to differ between the two situation displays. ANSP may, therefore, prescribe additional conditions for the application of this method, e.g.:

- i. a maximum distance from the common reference point used by the two controllers; and*
- ii. a maximum distance between the position indication as observed by the accepting controller and the one stated by the transferring controller.*
- g. where applicable, issuance of an instruction to the aircraft by the transferring controller to change SSR code and the observation of the change by the accepting controller; or
- h. issuance of an instruction to the aircraft by the transferring controller to squawk/transmit IDENT and observation of this response by the accepting controller.

Note.— Use of procedures g) and h) requires prior coordination between the controllers, since the indications to be observed by the accepting controller are of short duration.

8.6.4 Position information

An aircraft provided with ATS surveillance service should be informed of its position in the following circumstances:

- a. upon identification, except when the identification is established:
 - i. based on the pilot's report of the aircraft position or within one nautical mile of the runway upon departure and the observed position on the situation display is consistent with the aircraft's time of departure; or
 - ii. by use of ADS-B aircraft identification, Mode S aircraft identification or assigned discrete SSR codes and the location of the observed position indication is consistent with the current flight plan of the aircraft; or
- iii. by transfer of identification;

- b. when the pilot requests this information;
- c. when a pilot's estimate differs significantly from the controller's estimate based on the observed position;
- d. when the pilot is instructed to resume own navigation after vectoring if the current instructions had diverted the aircraft from a previously assigned route (see 8.6.5.5);
- e. immediately before termination of ATS surveillance service, if the aircraft is observed to deviate from its intended route.

Position information shall be passed to aircraft in one of the following forms:

- a. as a well-known geographical position;
- b. magnetic track and distance to a significant point, an en-route navigation aid, or an approach aid;
- c. direction (using points of the compass) and distance from a known position;
- d. distance to touchdown, if the aircraft is on final approach; or
- e. distance and direction from the centre line of an ATS route.

Whenever practicable, position information shall relate to positions or routes pertinent to the navigation of the aircraft concerned and shown on the situation display map.

When so informed, the pilot may omit position reports at compulsory reporting points or report only over those reporting points specified by the air traffic services unit concerned. Unless automated position reporting is in effect (e.g. ADS-C), pilots shall resume voice or CPDLC position reporting:

- a. when so instructed;
- b. when advised that the ATS surveillance service has been terminated; or
- c. when advised that identification is lost.

8.6.5 Vectoring

Vectoring shall be achieved by issuing to the pilot specific headings which will enable the aircraft to maintain the desired track. When vectoring an aircraft, a controller shall comply with the following:

- a. whenever practicable, the aircraft shall be vectored along tracks on which the pilot can monitor the aircraft position with reference to pilot-interpreted navigation aids (this will minimize the amount of navigational assistance required and alleviate the consequences resulting from an ATS surveillance system failure);
- b. when an aircraft is given its initial vector diverting it from a previously assigned route, the pilot should be informed what the vector is to accomplish, and the limit of the vector should be specified when the assigned heading is such that a loss of communication may result in a safety risk.(e.g. to ... position, for ... approach);

Note- CAR 19 – Safety Management defines a safety risk as the predicted probability and severity of the consequences or outcomes of a hazard.

- c. except when transfer of control is to be effected, aircraft shall not be vectored closer than 4.6 km (2.5 NM) or, where the minimum permissible separation is greater than 9.3 km (5 NM), a distance equivalent to one-half of the prescribed separation minimum, from the limit of the airspace for which the controller is responsible, unless local arrangements have been made to ensure that separation will exist with aircraft operating in adjoining areas;
- d. controlled flights shall not be vectored into uncontrolled airspace except in the case of emergency or in order to circumnavigate adverse meteorological conditions (in which case the pilot should be so informed), or at the specific request of the pilot; and
- e. when an aircraft has reported unreliable directional instruments, the pilot shall be requested, prior to the issuance of manoeuvring instructions, to make all turns at an agreed rate and to carry out the instructions immediately upon receipt.

When vectoring an IFR flight and when giving an IFR flight a direct routing which takes

the aircraft off an ATS route, the controller shall issue clearances such that the prescribed obstacle clearance will exist at all times until the aircraft reaches the point where the pilot will resume own navigation. When necessary, the relevant minimum vectoring altitude shall include a correction for low temperature effect.

Note 1.— When an IFR flight is being vectored, the pilot may be unable to determine the aircraft's exact position in respect to obstacles in this area and consequently the altitude which provides the required obstacle clearance. Detailed obstacle clearance criteria are contained in PANS-OPS (Doc 8168), Volumes I and II. See also 8.6.8.2.

Note 2.— It is the responsibility of the ATS authority to provide the controller with minimum altitudes corrected for temperature effect.

Whenever possible, minimum vectoring altitudes should be sufficiently high to minimize activation of aircraft ground proximity warning systems.

Note.— Activation of such systems will induce aircraft to pull up immediately and climb steeply to avoid hazardous terrain, possibly compromising separation between aircraft.

ANSP shall encourage operators to report incidents involving activations of aircraft ground proximity warning systems so that their locations can be identified and altitude, routing and/or aircraft operating procedures can be altered to prevent recurrences.

In terminating vectoring of an aircraft, the controller shall instruct the pilot to resume own navigation, giving the pilot the aircraft's position and appropriate instructions, as necessary, in the form prescribed in 8.6.4.2 b), if the current instructions had diverted the aircraft from a previously assigned route.

8.6.6 Navigation assistance

An identified aircraft observed to deviate significantly from its intended route or designated holding pattern shall be advised accordingly. Appropriate action shall also be taken if, in the opinion of the controller, such deviation is likely to affect the service being provided.

The pilot of an aircraft requesting navigation assistance from an air traffic control unit providing ATS surveillance services shall state the reason (e.g. to avoid areas of adverse weather or unreliable navigational instruments) and shall give as much information as possible in the circumstances.

8.6.7 Interruption or termination of ATS surveillance service

An aircraft which has been informed that it is provided with ATS surveillance service should be informed immediately when, for any reason, the service is interrupted or terminated.

Note.— The transition of an aircraft across adjoining areas of radar and/or ADS-B and/or MLAT systems coverage will not normally constitute an interruption or termination of the ATS surveillance service.

When the control of an identified aircraft is to be transferred to a control sector that will provide the aircraft with procedural separation, the transferring controller shall ensure that appropriate procedural separation is established between that aircraft and any other controlled aircraft before the transfer is effected.

8.6.8 Minimum levels

The controller shall at all times be in possession of full and up-to-date information regarding:

- a. established minimum flight altitudes within the area of responsibility;
- b. the lowest usable flight level or levels determined in accordance with Chapters 4 and 5;
and
- c. established minimum altitudes applicable to procedures based on tactical vectoring.

Unless otherwise specified by ANSP, minimum altitudes for procedures based on tactical vectoring with any ATS surveillance system shall be determined using the criteria applicable to tactical radar vectoring.

Note.— Criteria for the determination of minimum altitudes applicable to procedures based on tactical radar vectoring are contained in Procedures for Air Navigation Services — Aircraft Operations (PANS-OPS, Doc 8168), Volume II.

8.6.9 Information regarding adverse weather

Information that an aircraft appears likely to penetrate an area of adverse weather should be issued in sufficient time to permit the pilot to decide on an appropriate course of action, including that of requesting advice on how best to circumnavigate the adverse weather area, if so desired.

Note.— Depending on the capabilities of the ATS surveillance system, areas of adverse weather may not be presented on the situation display. An aircraft's weather radar will normally provide better detection and definition of adverse weather than radar sensors in use by ATS.

In vectoring an aircraft for circumnavigating any area of adverse weather, the controller should ascertain that the aircraft can be returned to its intended or assigned flight path within the coverage of the ATS surveillance system and, if this does not appear possible, inform the pilot of the circumstances.

Note.— Attention must be given to the fact that under certain circumstances the most active area of adverse weather may not be displayed.

8.6.10 Reporting of significant meteorological information to meteorological offices

Although a controller is not required to keep a special watch for heavy precipitation, etc., information on the position, intensity, extent and movement of significant meteorological conditions (i.e. heavy showers or well-defined frontal surfaces) as observed on situation displays should, when practicable, be reported to the associated meteorological office.

8.7 USE OF ATS SURVEILLANCE SYSTEMS IN THE AIR TRAFFIC CONTROL SERVICE

Note.— The procedures in this Section are general procedures applicable when an ATS surveillance system is used in the provision of area control service or approach control service.

Additional procedures applicable in the provision of approach control service are detailed in Section 8.9.

8.7.1 Functions

The information provided by ATS surveillance systems and presented on a situation display may be used to perform the following functions in the provision of air traffic control service:

- a. provide ATS surveillance services as necessary in order to improve airspace utilization, reduce delays, provide for direct routings and more optimum flight profiles, as well as to enhance safety;
- b. provide vectoring to departing aircraft for the purpose of facilitating an expeditious and efficient departure flow and expediting climb to cruising level;
- c. provide vectoring to aircraft for the purpose of resolving potential conflicts;
- d. provide vectoring to arriving aircraft for the purpose of establishing an expeditious and efficient approach sequence;
- e. provide vectoring to assist pilots in their navigation, e.g. to or from a radio navigation aid, away from or around areas of adverse weather;
- f. provide separation and maintain normal traffic flow when an aircraft experiences communication failure within the area of coverage;
- g. maintain flight path monitoring of air traffic;

Note.— Where tolerances regarding such matters as adherence to track, speed or time have been prescribed by the appropriate ATS authority, deviations are not considered significant until such tolerances are exceeded.

- h. when applicable, maintain a watch on the progress of air traffic, in order to provide a procedural controller with:
- i. improved position information regarding aircraft under control;

- ii. supplementary information regarding other traffic; and
- iii. information regarding any significant deviations by aircraft from the terms of their respective air traffic control clearances, including their cleared routes as well as levels, when appropriate.

8.7.2 Separation application

Note.— Factors which the controller using an ATS surveillance system must take into account in determining the spacing to be applied in particular circumstances in order to ensure that the separation minimum is not infringed include aircraft relative headings and speeds, ATS surveillance system technical limitations, controller workload and any difficulties caused by communication congestion. Guidance material on this subject is contained in the Air Traffic Services Planning Manual (Doc 9426).

Except as provided for in 8.7.2.8, 8.7.2.9 and 8.8.2.2, the separation minima specified in 8.7.3 and 8.7.4 shall only be applied between identified aircraft when there is reasonable assurance that identification will be maintained.

When control of an identified aircraft is to be transferred to a control sector that will provide the aircraft with procedural separation, such separation shall be established by the transferring controller before the aircraft reaches the limits of the transferring controller's area of responsibility, or before the aircraft leaves the relevant area of surveillance coverage.

When authorized by ANSP, separation based on the use of ADS-B, SSR and/or MLAT, and/or PSR position symbols and/or PSR blips shall be applied so that the distance between the centres of the position symbols and/or PSR blips, representing the positions of the aircraft concerned, is never less than a prescribed minimum.

Separation based on the use of PSR blips and SSR responses shall be applied so that the distance between the centre of the PSR blip and the nearest edge of the SSR response is never less than a prescribed minimum.

Separation based on the use of ADS-B position symbols and SSR responses shall be applied so that the distance between the centre of the ADS-B position symbol and the nearest edge of the SSR response is never less than a prescribed minimum.

Separation based on the use of SSR responses shall be applied so that the distance between the closest edges of the SSR responses is never less than a prescribed minimum.

In no circumstances shall the edges of the position indications touch or overlap unless vertical separation is applied between the aircraft concerned, irrespective of the type of position indication displayed and separation minimum applied.

In the event that the controller has been notified of a controlled flight entering or about to enter the airspace within which the separation minima specified in 8.7.3 is applied, but has not identified the aircraft, the controller may, if so prescribed by the appropriate ATS authority, continue to provide an ATS surveillance service to identified aircraft provided that:

reasonable assurance exists that the unidentified controlled flight will be identified using SSR and/or ADS-B and/or MLAT or the flight is being operated by an aircraft of a type which may be expected to give an adequate return on primary radar in the airspace within which the separation is applied; and

the separation is maintained between identified flights and any other observed ATS surveillance system position indications until either the unidentified controlled flight has been identified or procedural separation has been established.

The separation minima specified in 8.7.3 may be applied between an aircraft taking off and a preceding departing aircraft or other identified traffic provided there is reasonable assurance that the departing aircraft will be identified within 2 km (1 NM) from the end of the runway, and that, at the time, the required separation will exist.

The separation minima specified in 8.7.3 shall not be applied between aircraft holding over the same holding fix. Application of ATS surveillance system separation minima based on radar and/or ADS-B and/or MLAT systems between holding aircraft and other flights shall

be subject to requirements and procedures prescribed by the ANSP.

8.7.3 Separation minima based on ATS surveillance systems

Unless otherwise prescribed in accordance with 8.7.3.2, 8.7.3.3 or 8.7.3.4, or Chapter 6 (with respect to independent and dependent parallel approaches), the horizontal separation minimum based on radar and/or ADS-B and/or MLAT systems shall be 9.3 km (5.0 NM).

The separation minimum in 8.7.3.1 may, if so prescribed by the appropriate ANSP, be reduced, but not below:

2.7.3.1.1. 5.6 km (3.0 NM) when radar and/or ADS-B and/or MLAT systems' capabilities at a given location so permit; and

2.7.3.1.2. 4.6 km (2.5 NM) between succeeding aircraft which are established on the same final approach track within 18.5 km (10 NM) of the runway threshold. A reduced separation minimum of 4.6 km (2.5 NM) may be applied, provided:

- i. the average runway occupancy time of landing aircraft is proven, by means such as data collection and statistical analysis and methods based on a theoretical model, not to exceed 50 seconds;
- ii. braking action is reported as good and runway occupancy times are not adversely affected by runway contaminants such as slush, snow or ice;
- iii. an ATS surveillance system with appropriate azimuth and range resolution and an update rate of 5 seconds or less is used in combination with suitable displays;
- iv. the aerodrome controller is able to observe, visually or by means of surface movement radar (SMR), MLAT system or a surface movement guidance and control system (SMGCS), the runway-in-use and associated exit and entry taxiways;
- v. distance-based wake turbulence separation minima in 8.7.3.4, or as may be prescribed by the appropriate ATS authority (e.g. for specific aircraft types), do not apply;

- vi. aircraft approach speeds are closely monitored by the controller and when necessary adjusted so as to ensure that separation is not reduced below the minimum;
- vii. aircraft operators and pilots have been made fully aware of the need to exit the runway in an expeditious manner whenever the reduced separation minimum on final approach is applied; and
- viii. procedures concerning the application of the reduced minimum are published in AIP.

The separation minimum or minima based on radar and/or ADS-B and/or MLAT systems to be applied shall be prescribed by the ANSP according to the capability of the particular ATS surveillance system or sensor to accurately identify the aircraft position in relation to the centre of a position symbol, PSR blip, SSR response and taking into account factors which may affect the accuracy of the ATS surveillance system-derived information, such as aircraft range from the radar site and the range scale of the situation display in use.

When using wake turbulence categories contained in Chapter 4, 4.9.1.1, the following distance-based wake turbulence separation minima shall be applied to aircraft being provided with an ATS surveillance service in the approach and departure phases of flight in the circumstances given in 8.7.3.6.

| <i>Aircraft category</i> | | <i>Distance-based wake turbulence separation minima</i> |
|---------------------------|----------------------------|---|
| <i>Preceding aircraft</i> | <i>Succeeding aircraft</i> | |
| SUPER | HEAVY | 9.3 km (5.0 NM) |
| | MEDIUM | 13.0 km (7.0 NM) |
| | LIGHT | 14.9 km (8.0 NM) |
| HEAVY | HEAVY | 7.4 km (4.0 NM) |
| | MEDIUM | 9.3 km (5.0 NM) |
| | LIGHT | 11.1 km (6.0 NM) |
| MEDIUM | LIGHT | 9.3 km (5.0 NM) |

When applying the wake turbulence group in Chapter 4, 4.9.1.2, the following distance

-based wake based turbulence separation minima shall be applied to aircraft being provided with an ATS surveillance service in the approach and departure phases of flight, in the circumstances given in 8.7.3.6

| <i>Preceding aircraft group</i> | <i>Succeeding aircraft group</i> | <i>Distance-based wake turbulence separation minima</i> |
|---------------------------------|----------------------------------|---|
| A | B | 7.4 km (4.0 NM) |
| | C | 9.3 km (5.0 NM) |
| | D | 9.3 km (5.0 NM) |
| | E | 11.1 km (6.0 NM) |
| | F | 11.1 km (6.0 NM) |
| | G | 14.9 km (8.0 NM) |
| B | B | 5.6 km (3.0 NM) |
| | C | 7.4 km (4.0 NM) |
| | D | 7.4 km (4.0 NM) |
| | E | 9.3 km (5.0 NM) |
| | F | 9.3 km (5.0 NM) |
| | G | 13.0 km (7.0 NM) |
| C | D | 5.6 km (3.0 NM) |
| | E | 6.5 km (3.5.0 NM) |
| | F | 6.5 km (3.5.0 NM) |
| | G | 11.1 km (6.0 NM) |
| D | G | 7.4 km (4.0 NM) |
| E | G | 7.4 km (4.0 NM) |

The minima set out in 8.7.3.4 and 8.7.3.5 shall be applied when:

- 2.7.3.1.3. an aircraft is operating directly behind another aircraft at the same altitude or less than 300 m (1 000 ft) below (see Figure 8-1); or
- 2.7.3.1.4. both aircraft are using the same runway,
- 2.7.3.1.5. an aircraft is crossing behind another aircraft, at the same altitude or less than 300 m(1 000 ft) below (see Figure 8-1).

Fig. 8-1. Operating directly behind or crossing behind (see 8.7.3.4 and 8.7.3.5)

8.7.4 Separation minima using ATS surveillance systems where VHF voice communication is not available

Note 1.— Guidance material for the implementation of the navigation capability supporting the separation minima in 8.7.4.2, 8.7.4.3 and 8.7.4.4 is contained in the Performance-based Navigation (PBN) Manual (Doc 9613).

Note 2.— Guidance material for the implementation of communication and surveillance capability supporting the separation minima in 8.7.4.2, 8.7.4.3 and 8.7.4.4 is contained in the Performance based Communication and Surveillance (PBCS) Manual (Doc 9869) and the Global Operational Data Link (GOLD) Manual (Doc 10037).

Note 3.— Detailed information on the analysis used to determine these separation minima, as well as their implementation considerations, tolerable values for occupancy and deviation rates and associated monitoring procedures, are contained in the Manual for Separation Minima Using ATS Surveillance Systems Where VHF Voice Communication is not Available (Doc 10116).

Note 4.— Application of the separation minima in 8.7.4.2, 8.7.4.3 and 8.7.4.4 includes elements of both procedural control and ATS surveillance services; refer to Annex 1 — Personnel Licensing for applicable air traffic controller rating requirements.

Where direct controller-pilot VHF voice communication is not available, separation minima described in 8.7.4.2, 8.7.4.3 and 8.7.4.4 may be applied utilizing positioning information derived from an ATS surveillance system, provided the following requirements are met:

- a. a navigational performance of RNP 4 or RNP 2 shall be prescribed;
- b. the communication system shall satisfy RCP 240;
- c. an alternate means of communication shall be available so as to allow the controller to intervene and resolve a conflict within a total time of nine minutes, should the normal means of communication fail; and

Note.— The total time specified in c) includes the four minutes allocated to RCP 240.

- d. route conformance monitoring shall be ensured by the use of ATS surveillance system lateral deviation alerts with a warning threshold normally set at a maximum 3 NM.
 - i. Warning thresholds greater than 5.6 km (3.0 NM) may be set, provided the lateral separation minima in 8.7.4.2 a) and 8.7.4.3 are increased by 1.9 km (1.0 NM) for each 1.9 km (1.0 NM) that the warning threshold is increased; and
 - ii. ATS surveillance systems shall provide for the display of alerts in a clear and distinct manner, to enable immediate action by the controller in the event of a lateral deviation.

Unless otherwise prescribed in accordance with 8.7.4.3 and 8.7.4.4, the separation

minima shall be:

- 2.7.4.1.1. 35.2 km (19.0 NM) lateral spacing between parallel or non-intersecting tracks;
- 2.7.4.1.2. 35.2 km (19.0 NM) lateral separation of aircraft operating on intersecting tracks applied in accordance with section 5.4.1.2.1.5 a) and b);
- 2.7.4.1.3. 31.5 km (17.0 NM) longitudinal separation of aircraft operating on same tracks or crossing tracks applied in accordance with section 5.4.2.9.5 provided that the relative angle between the tracks is less than 90 degrees; and
- 2.7.4.1.4. opposite direction aircraft on reciprocal tracks may be cleared to climb or descend to or through the levels occupied by another aircraft, provided that surveillance position reports have been received from both aircraft demonstrating the aircraft have passed each other by 9.3 km (5.0 NM).

The separation minimum in 8.7.4.2 a) may, if so prescribed by the appropriate ATS authority, be reduced, but not below 27.8 km (15.0 NM), provided either:

- 2.7.4.1.5. the density of traffic in the airspace, as measured by occupancy, is less than 0.6; or
- 2.7.4.1.6. the proportion of total flight time spent by aircraft off the cleared track does not exceed the following:
 - i. for aircraft deviating 13.0 km (7.0 NM) or more off the cleared track, 3×10^{-5} per flight hour; and
 - ii. for aircraft deviating 20.4 km (11.0 NM) or more off the cleared track, 1×10^{-5} per flight hour.

The separation minimum in 8.7.4.2 c) may be reduced to 26 km (14 NM), provided that the relative angle between the tracks is less than 45 degrees.

Vectoring shall not be used in the application of these separation minima.

8.7.5 Transfer of control

Where an ATS surveillance service is being provided, transfer of control should be effected, whenever practicable, so as to enable the uninterrupted provision of the ATS surveillance service.

Where SSR and/or ADS-B and/or MLAT is used and the display of position indications with associated labels is provided for, transfer of control of aircraft between adjacent control positions or between adjacent ATC units may be effected without prior coordination, provided that:

2.7.5.1.1. updated flight plan information on the aircraft about to be transferred, including the discrete assigned SSR code or, with respect to Mode S and ADS-B, the aircraft identification, is provided to the accepting controller prior to transfer;

2.7.5.1.2. the ATS surveillance system coverage provided to the accepting controller is such that the aircraft concerned is presented on the situation display before the transfer is effected and is identified on, but preferably before, receipt of the initial call;

2.7.5.1.3. when the controllers are not physically adjacent, two-way direct speech facilities, which permit communications to be established instantaneously, are available between them at all times;

Note.— “Instantaneous” refers to communications which effectively provide for immediate access between controllers.

2.7.5.1.4. the transfer point or points and all other conditions of application, such as direction of flight, specified levels, transfer of communication points, and especially an agreed minimum separation between aircraft, including that applicable to succeeding aircraft on the same route, about to be transferred as observed on the situation display, have been made the subject of specific instructions (for intra-unit transfer) or of a specific letter of agreement between two adjacent ATC units;

2.7.5.1.5. the instructions or letter of agreement specify explicitly that the application

of this type of transfer of control may be terminated at any time by the accepting controller, normally with an agreed advance notice;

- 2.7.5.1.6. the accepting controller is informed of any level, speed or vectoring instructions given to the aircraft prior to its transfer and which modify its anticipated flight progress at the point of transfer.

The minimum agreed separation between aircraft about to be transferred (8.7.4.2 d) refers) and the advance notice (8.7.4.2 e) refers) shall be determined taking into account all relevant technical, operational and other circumstances. If circumstances arise in which these agreed conditions can no longer be satisfied, controllers shall revert to the procedure in 8.7.4.4 until the situation is resolved.

Where primary radar is being used, and where another type of ATS surveillance system is employed but the provisions of 8.7.4.2 are not applied, the transfer of control of aircraft between adjacent control positions or between two adjacent ATS units may be effected, provided that:

- 2.7.5.1.7. identification has been transferred to or has been established directly by the accepting controller;
- 2.7.5.1.8. when the controllers are not physically adjacent, two-way direct-speech facilities between them are at all times available which permit communications to be established instantaneously;
- 2.7.5.1.9. separation from other controlled flights conforms to the minima authorized for use during transfer of control between the sectors or units concerned;
- 2.7.5.1.10. the accepting controller is informed of any level, speed or vectoring instructions applicable to the aircraft at the point of transfer;
- 2.7.5.1.11. radio communication with the aircraft is retained by the transferring controller until the accepting controller has agreed to assume responsibility for providing the ATS surveillance service to the aircraft. Thereafter, the aircraft should be instructed to change over to the appropriate channel and from that point is the

responsibility of the accepting controller.

8.7.6 Speed control

Subject to conditions specified by the ANSP, including consideration of aircraft performance limitations, a controller may, in order to facilitate sequencing or to reduce the need for vectoring, request aircraft to adjust their speed in a specified manner.

Note.— Procedures for speed control instructions are contained in Chapter 4, Section 4.6.

8.8 EMERGENCIES, HAZARDS AND EQUIPMENT FAILURES

Note.— See also Chapter 15.

8.8.1 Emergencies

In the event of an aircraft in, or appearing to be in, any form of emergency, every assistance shall be provided by the controller, and the procedures prescribed herein may be varied according to the situation.

The progress of an aircraft in emergency shall be monitored and (whenever possible) plotted on the situation display until the aircraft passes out of coverage of the ATS surveillance system, and position information shall be provided to all air traffic services units which may be able to give assistance to the aircraft. Transfer to adjacent sectors shall also be effected when appropriate.

Note.— If the pilot of an aircraft encountering a state of emergency has previously been directed by ATC to select a specific transponder code and/or an ADS-B emergency mode, that code/mode will normally be maintained unless, in special circumstances, the pilot has decided or has been advised otherwise. Where ATC has not requested a code or emergency mode to be set, the pilot will set the transponder to Mode A Code 7700 and/or the appropriate ADS-B emergency mode.

Whenever a general ADS-B emergency alert is observed on the situation display and

there is no other indication of the particular nature of the emergency, the controller shall take the following action:

- 2.8.1.1.1. attempt to establish communication with the aircraft to verify the nature of the emergency; or
- 2.8.1.1.2. if no response is received from the aircraft, the controller shall attempt to ascertain if the aircraft is able to receive transmissions from the air traffic control unit by requesting it to execute a specified manoeuvre which can be observed on the situation display.

Note 1.— Some aircraft equipped with first generation ADS-B avionics have the capability to transmit a general emergency alert only, regardless of the code selected by the pilot.

Note 2.— Some aircraft equipped with first generation ADS-B avionics do not have the capability of squawking IDENT while the emergency and/or urgency mode is selected.

8.8.2 Collision hazard information

When an identified controlled flight is observed to be on a conflicting path with an unknown aircraft deemed to constitute a collision hazard, the pilot of the controlled flight shall, whenever practicable:

- 2.8.2.1.1. be informed of the unknown aircraft, and if so requested by the controlled flight or if, in the opinion of the controller, the situation warrants, a course of avoiding action should be suggested; and
- 2.8.2.1.2. be notified when the conflict no longer exists.

When an identified IFR flight operating outside controlled airspace is observed to be on a conflicting path with another aircraft, the pilot should:

- 2.8.2.1.3. be informed as to the need for collision avoidance action to be initiated, and if so requested by the pilot or if, in the opinion of the controller, the situation warrants, a course of avoiding action should be suggested; and

2.8.2.1.4. be notified when the conflict no longer exists.

Information regarding traffic on a conflicting path should be given, whenever practicable, in the following form:

2.8.2.1.5. relative bearing of the conflicting traffic in terms of the 12-hour clock;

2.8.2.1.6. distance from the conflicting traffic in kilometres (nautical miles);

2.8.2.1.7. direction in which the conflicting traffic appears to be proceeding;

2.8.2.1.8. level and type of aircraft or, if unknown, relative speed of the conflicting traffic, e.g. slow or fast.

Pressure-altitude-derived level information, even when unverified, should be used in the provision of collision hazard information because such information, particularly if available from an otherwise unknown aircraft (e.g. a VFR flight) and given to the pilot of a known aircraft, could facilitate the location of a collision hazard.

When the pressure-altitude-derived level information has been verified, the information shall be passed to pilots in a clear and unambiguous manner. If the level information has not been verified, the accuracy of the information should be considered uncertain and the pilot shall be informed accordingly.

8.8.3 Failure of equipment

AIRCRAFT RADIO TRANSMITTER FAILURE

If two-way communication is lost with an aircraft, the controller should determine whether or not the aircraft's receiver is functioning by instructing the aircraft on the channel so far used to acknowledge by making a specified manoeuvre and by observing the aircraft's track, or by instructing the aircraft to operate IDENT or to make SSR code and/or ADS-B transmission changes.

Note 1.— Transponder-equipped aircraft experiencing radio communication failure will operate the transponder on Mode A Code 7600.

Note 2.— ADS-B-equipped aircraft experiencing radio communication failure may transmit the appropriate ADS-B emergency and/or urgency mode.

If the action prescribed in 8.8.3.1.1 is unsuccessful, it shall be repeated on any other available channel on which it is believed that the aircraft might be listening.

In both the cases covered by 8.8.3.1.1 and 8.8.3.1.2, any manoeuvring instructions shall be such that the aircraft would regain its current cleared track after having complied with the instructions received.

Where it has been established by the action in 8.8.3.1.1 that the aircraft's radio receiver is functioning, continued control can be effected using SSR code/ADS-B transmission changes or IDENT transmissions to obtain acknowledgement of clearances issued to the aircraft.

COMPLETE AIRCRAFT COMMUNICATION FAILURE

When a controlled aircraft experiencing complete communication failure is operating or expected to operate in an area and at flight levels where an ATS surveillance service is applied, separation specified in 8.7.3 may continue to be used. However, if the aircraft experiencing the communication failure is not identified, separation shall be applied between identified aircraft and all unidentified aircraft observed along the expected route of the aircraft with the communication failure, until such time as it is known, or can safely be assumed, that the aircraft with radio communication failure has passed through the airspace concerned, has landed, or has proceeded elsewhere.

AIRCRAFT TRANSPONDER FAILURE IN AREAS WHERE THE CARRIAGE OF A FUNCTIONING TRANSPONDER IS MANDATORY

When an aircraft experiencing transponder failure after departure is operating or expected to operate in an area where the carriage of a functioning transponder with specified capabilities is mandatory, the ATC units concerned should endeavor to provide for continuation of the flight to the aerodrome of first intended landing in accordance with the flight plan. However, in certain traffic situations, either in terminal areas or en-route, continuation of the flight may not be possible, particularly when failure is detected shortly after take-off. The aircraft may then be required to

return to the departure aerodrome or to land at the nearest suitable aerodrome acceptable to the operator concerned and to ATC.

In case of a transponder failure which is detected before departure from an aerodrome where it is not practicable to effect a repair, the aircraft concerned should be permitted to proceed, as directly as possible, to the nearest suitable aerodrome where repair can be made. When granting clearance to such aircraft, ATC should take into consideration the existing or anticipated traffic situation and may have to modify the time of departure, flight level or route of the intended flight. Subsequent adjustments may become necessary during the course of the flight.

8.8.4 ATS surveillance system failure

In the event of complete failure of the ATS surveillance system where air-ground communications remain, the controller shall plot the positions of all aircraft already identified, take the necessary action to establish procedural separation between the aircraft and, if necessary, limit the number of aircraft permitted to enter the area.

As an emergency measure, use of flight levels spaced by half the applicable vertical separation minimum may be resorted to temporarily if standard procedural separation cannot be provided immediately.

8.8.5 Degradation of aircraft position source data

In order to reduce the impact of a degradation of aircraft position source data, for example, a receiver autonomous integrity monitoring (RAIM) outage for GNSS, the ANSP shall establish contingency procedures to be followed by control positions and ATC units in the event of data degradation.

8.8.6 Ground radio failure

In the event of complete failure of the ground radio equipment used for control, the controller shall, unless able to continue to provide the ATS surveillance service by means of other available communication channels, proceed as follows:

- a. without delay inform all adjacent control positions or ATC units, as applicable, of the failure;
- b. apprise such positions or units of the current traffic situation;
- c. request their assistance, in respect of aircraft which may establish communications with those positions or units, in establishing and maintaining separation between such aircraft; and
- d. instruct adjacent control positions or ATC units to hold or re-route all controlled flights outside the area of responsibility of the position or ATC unit that has experienced the failure until such time that the provision of normal services can be resumed.

In order to reduce the impact of complete ground radio equipment failure on the safety of air traffic, the appropriate ATS authority should establish contingency procedures to be followed by control positions and ATC units in the event of such failures. Where feasible and practicable, such contingency procedures should provide for the delegation of control to an adjacent control position or ATC unit in order to permit a minimum level of services to be provided as soon as possible, following the ground radio failure and until normal operations can be resumed.

8.9 USE OF ATS SURVEILLANCE SYSTEMS IN THE APPROACH CONTROL SERVICE

8.9.1 General provisions

ATS surveillance systems used in the provision of approach control service shall be appropriate to the functions and level of service to be provided.

ATS surveillance systems used to monitor parallel ILS approaches shall meet the requirements for such operations specified in Chapter 6.

8.9.2 Functions

The position indications presented on a situation display may be used to perform the following additional functions in the provision of approach control service:

- a. provide vectoring of arriving traffic on to pilot-interpreted final approach aids;
- b. provide flight path monitoring of parallel ILS approaches and instruct aircraft to take appropriate action in the event of possible or actual penetrations of the no transgression zone (NTZ);

Note.— See Chapter 6, Section 6.7.

- c. provide vectoring of arriving traffic to a point from which a visual approach can be completed;
- d. provide vectoring of arriving traffic to a point from which a precision radar approach or a surveillance radar approach can be made;
- e. provide flight path monitoring of other pilot-interpreted approaches;
- f. in accordance with prescribed procedures, conduct:
 - i. surveillance radar approaches;
 - ii. precision radar (PAR) approaches; and
- g. provide separation between:
 - i. succeeding departing aircraft;
 - ii. succeeding arriving aircraft; and
 - iii. a departing aircraft and a succeeding arriving aircraft.

8.9.3 General approach control procedures using ATS surveillance systems

The ANSP shall establish procedures to ensure that the aerodrome controller is kept informed of the sequence of arriving aircraft, as well as any instructions and restrictions which have been

issued to such aircraft in order to maintain separation after transfer of control to the aerodrome controller.

Prior to, or upon commencement of, vectoring for approach, the pilot shall be advised of the type of approach as well as the runway to be used.

The controller shall advise an aircraft being vectored for an instrument approach of its position at least once prior to commencement of final approach.

When giving distance information, the controller shall specify the point or navigation aid to which the information refers.

The initial and intermediate approach phases of an approach executed under the direction of a controller comprise those parts of the approach from the time vectoring is initiated for the purpose of positioning the aircraft for a final approach, until the aircraft is on final approach and:

- a. established on the final approach path of a pilot-interpreted aid; or
- b. reports that it is able to complete a visual approach; or
- c. ready to commence a surveillance radar approach; or
- d. transferred to the precision radar approach controller.

Aircraft vectored for final approach should be given a heading or a series of headings calculated to close with the final approach track. The final vector shall enable the aircraft to be established on the final approach track prior to intercepting the specified or nominal glide path of the approach procedure from below, and should provide an intercept angle with the final approach track of 45 degrees or less.

Note.— See Chapter 6, Section 6.7.3.2, and Section 6.7.3.2 concerning vectoring and level flight requirements of independent parallel approaches, respectively.

Whenever an aircraft is assigned a vector which will take it through the final approach track, it should be advised accordingly, stating the reason for the vector.

8.10 USE OF ATS SURVEILLANCE SYSTEMS IN THE AERODROME CONTROL SERVICE

8.10.1 Functions

When authorized by and subject to conditions prescribed by the ANSP, ATS surveillance systems may be used in the provision of aerodrome control service to perform the following functions:

- a. flight path monitoring of aircraft on final approach;
- b. flight path monitoring of other aircraft in the vicinity of the aerodrome;
- c. establishing separation specified in 8.7.3 between succeeding departing aircraft; and
- d. providing navigation assistance to VFR flights.

Special VFR flights shall not be vectored unless special circumstances, such as emergencies, dictate otherwise.

Caution shall be exercised when vectoring VFR flights so as to ensure that the aircraft concerned does not inadvertently enter instrument meteorological conditions.

In prescribing conditions and procedures for the use of ATS surveillance systems in the provision of aerodrome control service, the ANSP shall ensure that the availability and use of an ATS surveillance system will not be detrimental to visual observation of aerodrome traffic.

Note.— Control of aerodrome traffic is in the main based on visual observation of the manoeuvring area and the vicinity of the aerodrome by the aerodrome controller.

8.10.2 Use of ATS surveillance systems for surface movement control

Note.— Requirements concerning surface movement guidance and control systems (SMGCS) are contained in Annex 14, Volume I, Chapter 9. Guidance on the use of surface movement radar (SMR) and other advanced functions is contained in the Manual of Surface Movement Guidance

and Control Systems (SMGCS) (*Doc 9476*) and in the Advanced Surface Movement Guidance and Control Systems (A-SMGCS) Manual (*Doc 9830*).

8.10.2.1 GENERAL PROVISIONS

The use of SMR should be related to the operational conditions and requirements of the particular aerodrome (i.e. visibility conditions, traffic density and aerodrome layout).

SMR systems shall to the extent possible enable the detection and display of the movement of all aircraft and vehicles on the manoeuvring area in a clear and unambiguous manner.

Aircraft and vehicle position indications may be displayed in symbolic or non-symbolic form. Where labels are available for display, the capability should be provided for inclusion of aircraft and vehicle identification by manual or automated means.

8.10.2.2 FUNCTIONS

SMR should be used to augment visual observation of traffic on the manoeuvring area and to provide surveillance of traffic on those parts of the manoeuvring area which cannot be observed visually.

The information displayed on an SMR display may be used to assist in:

- a. monitoring of aircraft and vehicles on the manoeuvring area for compliance with clearances and instructions;
- b. determining that a runway is clear of traffic prior to a landing or take-off;
- c. providing information on essential local traffic on or near the manoeuvring area;
- d. determining the location of aircraft and vehicles on the manoeuvring area;
- e. providing directional taxi information to aircraft when requested by the pilot or deemed necessary by the controller. Except under special circumstances, e.g. emergencies, such information should not be issued in the form of specific heading instructions; and

- f. providing assistance and advice to emergency vehicles.

8.10.2.3 IDENTIFICATION OF AIRCRAFT

Where an ATS surveillance system is used, aircraft may be identified by one or more of the following procedures:

- a. by correlating a particular position indication with:
 - i. an aircraft position visually observed by the controller;
 - ii. an aircraft position reported by the pilot; or
 - iii. an identified position indication displayed on a situation display;
- b. by transfer of identification when authorized by the appropriate ATS authority; and
- c. by automated identification procedures when authorized by the appropriate ATS authority.

8.11 USE OF ATS SURVEILLANCE SYSTEMS IN THE FLIGHT INFORMATION SERVICE

Note.— The use of an ATS surveillance system in the provision of flight information service does not relieve the pilot-in-command of an aircraft of any responsibilities, including the final decision regarding any suggested alteration of the flight plan.

8.11.1 Functions

The information presented on a situation display may be used to provide identified aircraft with:

- a. information regarding any aircraft observed to be on a conflicting path with the identified aircraft and suggestions or advice regarding avoiding action;
- b. information on the position of significant weather and, as practicable, advice to the

- c. aircraft on how best to circumnavigate any such areas of adverse weather (see 8.6.9.2, Note);
- d. information to assist the aircraft in its navigation.

CHAPTER 9

FLIGHT INFORMATION SERVICE AND ALERTING SERVICE

9.1 FLIGHT INFORMATION SERVICE

9.1.1 Recording and transmission of information on the progress of flights

Information on the actual progress of flights, including those of heavy or medium unmanned free balloons, not under air traffic control service shall be:

- a. recorded by the air traffic services unit serving the FIR within which the aircraft is flying in such a manner that it is available for reference and in case it is requested for search and rescue action;
- b. transmitted by the air traffic services unit receiving the information to other air traffic services units concerned, when so required in accordance with Chapter 10, 10.2.2.

9.1.2 Transfer of responsibility for the provision of flight information service

The responsibility for the provision of flight information service to a flight normally passes from the appropriate ATS unit in an FIR to the appropriate ATS unit in the adjacent FIR at the time of crossing the common FIR boundary. However, when coordination is required in accordance with Chapter 10, 10.2, but communication facilities are inadequate, the former ATS unit shall, as far as practicable, continue to provide flight information service to the flight until it has established two way communication with the appropriate ATS unit in the FIR it is entering.

9.1.2 Transmission of information

9.1.3.1 MEANS OF TRANSMISSION

9.1.3.1.1 Except as provided in 9.1.3.2.1, information shall be disseminated to aircraft by one or more of the following means as determined by the ANSP:

- a. the preferred method of directed transmission on the initiative of the appropriate ATS unit to an aircraft, ensuring that receipt is acknowledged; or

- b. a general call, unacknowledged transmission to all aircraft concerned; or
- c. broadcast; or
- d. data link.

Note.— It should be recognized that in certain circumstances, e.g. during the last stages of a final approach, it may be impracticable for aircraft to acknowledge directed transmissions.

9.1.3.1.2 The use of general calls shall be limited to cases where it is necessary to disseminate essential information to several aircraft without delay, e.g. the sudden occurrence of hazards, a change of the runway-in-use, or the failure of a key approach and landing aid.

9.1.3.2 TRANSMISSION OF SPECIAL AIR-REPORTS, SIGMET AND AIRMET INFORMATION

9.1.3.2.1 Appropriate SIGMET and AIRMET information, as well as special air-reports which have not been used for the preparation of a SIGMET, shall be disseminated to aircraft by one or more of

the means specified in 9.1.3.1.1 as determined by CAAN on the basis of regional air navigation agreements. Special air-reports shall be disseminated to aircraft for a period of 60 minutes after their issuance.

9.1.3.2.2 The special air-report, SIGMET and AIRMET information to be passed to aircraft on ground initiative should cover a portion of the route up to one hour's flying time ahead of the aircraft except when another period has been determined by CAAN on the basis of regional air navigation agreements.

9.1.3.3 TRANSMISSION OF INFORMATION CONCERNING VOLCANIC ACTIVITY

Information concerning pre-eruption volcanic activity, volcanic eruptions and volcanic ash clouds (position of clouds and flight levels affected) shall be disseminated to aircraft by one or

more of the means specified in 9.1.3.1.1 as determined by CAAN on the basis of regional air navigation agreements.

9.1.3.4 TRANSMISSION OF INFORMATION CONCERNING RADIOACTIVE MATERIALS AND TOXIC CHEMICAL CLOUDS

Information on the release into the atmosphere of radioactive materials or toxic chemicals which could affect airspace within the area of responsibility of the ATS unit shall be transmitted to aircraft by one or more of the means specified in 9.1.3.1.1.

9.1.3.5 TRANSMISSION OF SPECI AND AMENDED TAF

9.1.3.5.1 Special reports in the SPECI code form and amended TAF shall be transmitted on request and supplemented by:

- a. directed transmission from the appropriate air traffic services unit of selected special reports and amended TAF for the departure, destination and its alternate aerodromes, as listed in the flight plan; or
- b. a general call on appropriate frequencies for the unacknowledged transmission to affected aircraft of selected special reports and amended TAF; or
- c. continuous or frequent broadcast or the use of data link to make available current METAR and TAF in areas determined by CAAN on the basis of regional air navigation agreements where traffic congestion dictates. VOLMET broadcasts and/or D-VOLMET should be used to serve this purpose (see CAR 11, 4.4).

9.1.3.5.2 The passing of amended aerodrome forecasts to aircraft on the initiative of the appropriate air traffic services unit should be limited to that portion of the flight where the aircraft is within a specified time from the aerodrome of destination, such time being established by CAAN on the basis of regional air navigation agreements.

9.1.3.6 TRANSMISSION OF INFORMATION ON HEAVY OR MEDIUM UNMANNED FREE BALLONS

Appropriate information on heavy or medium unmanned free balloons shall be disseminated to aircraft by one or more of the means specified in 9.1.3.1.1.

9.2 ALERTING SERVICE

9.2.1 Aircraft

Note.— Whenever applied, the procedure for the provision of air traffic control service take the place of the following procedures, except when relevant procedures do not call for more than hourly position reports, in which case the Operations normal procedure applies.

- 9.2.1.1 When so required by the ANSP to facilitate the provision of alerting and search and rescue services, an aircraft, prior to and when operating within or into designated areas or along designated routes, shall comply with the provisions detailed in CAR 2, Chapter 3, concerning the submission, completion, changing and closing of a flight plan.
- 9.2.1.2 In addition to the above, aircraft equipped with suitable two-way radiocommunications shall report during the period twenty to forty minutes following the time of last contact, whatever the purpose of such contact, merely to indicate that the flight is progressing according to plan, such report to comprise identification of the aircraft and the words “Operations normal”.
- 9.2.1.3 The “Operations normal” message shall be transmitted air-ground to an appropriate air traffic services unit.
- 9.2.1.4 It may be advisable, in case of a SAR operation of a substantial duration, to promulgate by NOTAM the lateral and vertical limits of the area of SAR action, and to warn aircraft not engaged in actual SAR operations and not controlled by air traffic control to avoid such areas unless otherwise authorized by the appropriate ATS unit.

9.2.2 Air traffic services units

- 9.2.2.1 When no report from an aircraft has been received within a reasonable period of time (which may be a specified interval prescribed on the basis of regional air navigation

agreements) after a scheduled or expected reporting time, the ATS unit shall, within the stipulated period of thirty minutes, endeavour to obtain such report in order to be in a position to apply the provisions relevant to the “Uncertainty Phase” should circumstances warrant such application.

9.2.2.2 When alerting service is required in respect of a flight operated through more than one FIR or control area, and when the position of the aircraft is in doubt, responsibility for coordinating such service shall rest with the ATS unit of the FIR or control area:

- a. within which the aircraft was flying at the time of last air-ground radio contact;
- b. that the aircraft was about to enter when last air-ground contact was established at or close to the boundary of two FIRs or control areas;
- c. within which the aircraft’s intermediate stop or final destination point is located:
 - i. if the aircraft was not equipped with suitable two-way radio communication equipment;
or
 - ii. was not under obligation to transmit position reports.

9.2.2.3 The unit responsible for alerting service, in accordance with 9.2.2.2, shall:

- a. notify units providing alerting service in other affected FIRs or control areas of the emergency phase or phases, in addition to notifying the rescue coordination centre associated with it;
- b. request those units to assist in the search for any useful information pertaining to the aircraft presumed to be in an emergency, by all appropriate means and especially those indicated in 5.3 of CAR 11 (Use of communication facilities);
- c. collect the information gathered during each phase of the emergency and, after verifying it as necessary, transmit it to the rescue coordination centre;
- d. announce the termination of the state of emergency as circumstances dictate.

- 9.2.2.4 In obtaining the necessary information as required under 5.2.2.1 of CAR 11, attention shall particularly be given to informing the relevant rescue coordination centre of the distress frequencies available to survivors, as listed in Item 19 of the flight plan but not normally transmitted.

CHAPTER 10

COORDINATION

10.1 COORDINATION IN RESPECT OF THE PROVISION OF AIR TRAFFIC CONTROL SERVICE

10.1.1 General

10.1.1.1 The coordination and transfer of control of a flight between successive ATC units and control sectors shall be effected by a dialogue comprising the following stages:

- a. notification of the flight in order to prepare for coordination, as necessary;
- b. coordination of conditions of transfer of control by the transferring ATC unit;
- c. coordination, if necessary, and acceptance of conditions of transfer of control by the accepting ATC unit; and
- d. the transfer of control to the accepting ATC unit or control sector.

10.1.1.2 ATC units should, to the extent possible, establish and apply standardized procedures for the coordination and transfer of control of flights, in order, *inter alia*, to reduce the need for verbal coordination. Such coordination procedures shall conform to the procedures contained in the following provisions and be specified in letters of agreement and local instructions, as applicable.

10.1.1.3 Such agreements and instructions shall cover the following as applicable:

- a. definition of areas of responsibility and common interest, airspace structure and airspace classification(s);
- b. any delegation of responsibility for the provision of ATS;
- c. procedures for the exchange of flight plan and control data, including use of automated and/or verbal coordination messages;

- d. means of communication;
- e. requirements and procedures for approval requests;
- f. significant points, levels or times for transfer of control;
- g. significant points, levels or times for transfer of communication;
- h. conditions applicable to the transfer and acceptance of control, such as specified altitudes/flight levels, specific separation minima or spacing to be established at the time of transfer, and the use of automation;
- i. ATS surveillance system coordination procedures;
- j. SSR code assignment procedures;
- k. procedures for departing traffic;
- l. designated holding fixes and procedures for arriving traffic;
- m. applicable contingency procedures; and
- n. any other provisions or information relevant to the coordination and transfer of control of flights.

10.1.2 Coordination between ATC units providing air traffic service within contiguous control areas

10.1.2.1 GENERAL

10.1.2.1.1 ATC units shall forward from unit to unit, as the flight progresses, necessary flight plan and control information. When so required by agreement between the appropriate ATS authorities to assist in the separation of aircraft, flight plan and flight progress information for flights along specified routes or portions of routes in close proximity to flight information region boundaries shall also be provided to the ATC units in charge of the flight information regions adjacent to such routes or portions of routes.

Note 1.— Such a route or portion of route is often referred to as an area of common interest, the extent of which is usually determined by the required separation minima.

Note 2.— See also 10.2.4.

10.1.2.1.2 The flight plan and control information shall be transmitted in sufficient time to permit reception and analysis of the data by the receiving unit(s) and necessary coordination between the units concerned.

10.1.2.2 TRANSFER OF CONTROL

10.1.2.2.1 The responsibility for the control of an aircraft shall be transferred from the ATC unit to the next unit at the time of crossing the common control area boundary as determined by the unit having control of the aircraft or at such other point or time as has been agreed between the two units.

10.1.2.2.2 Where specified in letters of agreement between the ATC units concerned, and when transferring an aircraft, the transferring unit shall notify the accepting unit that the aircraft is in position to be transferred, and specify that the responsibility for control should be assumed by the accepting unit forthwith at the time of crossing the control boundary or other transfer control point specified in letters of agreement between the ATC units or at such other point or time coordinated between the two units.

10.1.2.2.3 If the transfer of control time or point is other than forthwith, the accepting ATC unit shall not alter the clearance of the aircraft prior to the agreed transfer of control time or point without the approval of the transferring unit.

10.1.2.2.4 If transfer of communication is used to transfer an aircraft to a receiving ATC unit, responsibility for control shall not be assumed until the time of crossing the control area boundary or other transfer of control point specified in letters of agreement between the ATC units.

10.1.2.2.5 When transfer of control of identified aircraft is to be effected, the appropriate procedures specified in Chapter 8, Section 8.7.4, shall be applied.

10.1.2.3 APPROVAL REQUESTS

10.1.2.3.1 If the flying time from the departure aerodrome of an aircraft to the boundary of an adjacent control area is less than the specified minimum required to permit transmission of the necessary flight plan and control information to the accepting ATC unit after take-off and allow adequate time for reception, analysis and coordination, the transferring ATC unit shall, prior to departure, forward that information to the accepting ATC unit together with a request for approval. The required time period shall be specified in letters of agreement or local instructions, as appropriate. In the case of revisions to a previously transmitted current flight plan, and control data being transmitted earlier than this specified time period, no approval from the accepting ATC unit shall be required.

10.1.2.3.2 In the case of an aircraft in flight requiring an initial clearance when the flying time to the boundary of an adjacent control area is less than a specified minimum, the aircraft shall be held within the transferring ATC unit's control area until the flight plan and control information have been forwarded together with a request for approval, and coordination effected, with the adjacent ATC unit.

10.1.2.3.3 In the case of an aircraft requesting a change in its current flight plan, or of a transferring ATC unit proposing to change the current flight plan of an aircraft, and the flying time of the aircraft to the control area boundary is less than a specified minimum, the revised clearance shall be withheld pending approval of the proposal by the adjacent ATC unit.

10.1.2.3.4 When boundary estimate data are to be transmitted for approval by the accepting unit, the time in respect of an aircraft not yet departed shall be based upon the estimated time of departure as determined by the ATC unit in whose area of responsibility the departure aerodrome is located. In respect of an aircraft in flight requiring an initial clearance, the time shall be based on the estimated elapsed time from the holding fix to the boundary plus the time expected to be needed for coordination.

10.1.2.3.5 The conditions, including specified flying times, under which approval requests shall be forwarded, shall be specified in letters of agreement or local instructions as appropriate.

10.1.2.4 TRANSFER OF COMMUNICATION

10.1.2.4.1 Except when separation minima specified in 8.7.3 are being applied, the transfer of air ground communications of an aircraft from the transferring to the accepting ATC unit shall be made five minutes before the time at which the aircraft is estimated to reach the common control area boundary, unless otherwise agreed between the two ATC units concerned.

10.1.2.4.2 When separation minima specified in 8.7.3 are being applied at the time of transfer of control, the transfer of air-ground communications of an aircraft from the transferring to the accepting ATC unit shall be made immediately after the accepting ATC unit has agreed to assume control.

10.1.2.4.3 The accepting ATC unit shall normally not be required to notify the transferring unit that radio and/or data communication has been established with the aircraft being transferred and that control of the aircraft has been assumed, unless otherwise specified by agreement between the ATC units concerned. The accepting ATC unit shall notify the transferring unit in the event that communication with the aircraft is not established as expected.

10.1.2.4.4 In cases where a portion of a control area is so situated that the time taken by aircraft to traverse it is of a limited duration, agreement should be reached to provide for direct transfer of communication between the units responsible for the adjacent control areas, provided that the intermediate unit is fully informed of such traffic. The intermediate unit shall retain responsibility for coordination and for ensuring that separation is maintained between all traffic within its area of responsibility.

10.1.2.4.5 An aircraft may be permitted to communicate temporarily with a control unit other than the unit controlling the aircraft.

10.1.2.5 TERMINATION OF CONTROLLED FLIGHT

In the case where a flight ceases to be operated as a controlled flight, i.e. by leaving controlled airspace or by cancelling its IFR flight and proceeding on VFR in airspace where VFR flights are not controlled, the ATC unit concerned shall ensure that appropriate information on the flight is forwarded to ATS unit(s) responsible for the provision of flight information and alerting services for the remaining portion of the flight, in order to ensure that such services will be provided to the aircraft.

10.1.3 Coordination between a unit providing area control service and a unit providing approach control service

10.1.3.1 DIVISION OF CONTROL

10.1.3.1.1 Except when otherwise specified in letters of agreement or local instructions, or by the ACC concerned in individual cases, a unit providing approach control service may issue clearances to any aircraft released to it by an ACC without reference to the ACC. However, when an approach has been missed the ACC shall, if affected by the missed approach, be advised immediately and subsequent action coordinated between the ACC and the unit providing approach control service as necessary.

10.1.3.1.2 An ACC may, after coordination with the unit providing approach control service, release aircraft directly to aerodrome control towers if the entire approach will be made under visual meteorological conditions.

10.1.3.2 TAKE-OFF AND CLEARANCE EXPIRY TIMES

10.1.3.2.1 Time of take-off shall be specified by the ACC when it is necessary to:

- a. coordinate the departure with traffic not released to the unit providing approach control service; and
- b. provide en-route separation between departing aircraft following the same track.

10.1.3.2.2 If time of take-off is not specified, the unit providing approach control service shall determine the take-off time when necessary to coordinate the departure with traffic released to it.

10.1.3.2.3 A clearance expiry time shall be specified by the ACC if a delayed departure would conflict with traffic not released to the unit providing approach control service. If, for traffic reasons of its own, a unit providing approach control service has to specify in addition its own clearance expiry time, this shall not be later than that specified by the ACC.

10.1.3.3 EXCHANGE OF MOVEMENT AND CONTROL DATA

10.1.3.3.1 The unit providing approach control service shall keep the ACC promptly advised of pertinent data on controlled traffic such as:

- a. runway(s)-in-use and expected type of instrument approach procedure;
- b. lowest vacant level at the holding fix available for use by the ACC;
- c. average time interval or distance between successive arrivals as determined by the unit providing approach control service;
- d. revision of the expected approach time issued by the ACC when the calculation of the expected approach time by the unit providing approach control service indicates a variation of five minutes or such other time as has been agreed between the two ATC units concerned;
- e. arrival times over the holding fix when these vary by three minutes, or such other time as has been agreed between the two ATC units concerned, from those previously estimated;
- f. cancellations by aircraft of IFR flight, if these will affect levels at the holding fix or expected approach times of other aircraft;
- g. aircraft departure times or, if agreed between the two ATC units concerned, the estimated time at the control area boundary or other specified point;
- h. all available information relating to overdue or unreported aircraft;
- i. missed approaches which may affect the ACC.

10.1.3.3.2 The ACC shall keep the unit providing approach control service promptly advised of pertinent data on controlled traffic such as:

- a. identification, type and point of departure of arriving aircraft;
- b. estimated time and proposed level of arriving aircraft over holding fix or other specified point;
- c. actual time and proposed level of arriving aircraft over holding fix if aircraft is released

- to the unit providing approach control service after arrival over the holding fix;
- d. requested type of IFR approach procedure if different to that specified by the approach control unit;
- e. expected approach time issued;
- f. when required, statement that aircraft has been instructed to contact the unit providing approach control service;
- g. when required, statement that an aircraft has been released to the unit providing approach control service including, if necessary, the time and conditions of release;
- h. anticipated delay to departing traffic due to congestion.

10.1.3.3.3 Information on arriving aircraft shall be forwarded not less than fifteen minutes before estimated time of arrival and such information shall be revised as necessary.

10.1.4 Coordination between a unit providing approach control service and a unit providing aerodrome control service

10.1.4.1 DIVISION OF CONTROL

10.1.4.1.1 A unit providing approach control service shall retain control of arriving aircraft until such aircraft have been transferred to the aerodrome control tower and are in communication with the aerodrome control tower. Letters of agreement or local instructions, appropriate to the airspace structure, terrain, meteorological conditions and ATS facilities available, shall establish rules for the transfer of arriving aircraft.

10.1.4.1.2 A unit providing approach control service may authorize an aerodrome control tower to release an aircraft for take-off subject to the discretion of the aerodrome control tower with respect to arriving aircraft.

10.1.4.1.3 Aerodrome control towers shall, when so prescribed in letters of agreement or local instructions, obtain approval from the unit providing approach control service prior to authorizing operation of special VFR flights.

10.1.4.2 EXCHANGE OF MOVEMENT AND CONTROL DATA

10.1.4.2.1 An aerodrome control tower shall keep the unit providing approach control service promptly advised of pertinent data on relevant controlled traffic such as:

- a. arrival and departure times;
- b. when required, statement that the first aircraft in an approach sequence is in communication with and is sighted by the aerodrome control tower, and that reasonable assurance exists that a landing can be accomplished;
- c. all available information relating to overdue or unreported aircraft;
- d. information concerning missed approaches;
- e. information concerning aircraft that constitute essential local traffic to aircraft under the control of the unit providing approach control service.

10.1.4.2.2 The unit providing approach control service shall keep the aerodrome control tower promptly advised of pertinent data on controlled traffic such as:

- a. estimated time and proposed level of arriving aircraft over the aerodrome, at least fifteen minutes prior to estimated arrival;
- b. when required, a statement that an aircraft has been instructed to contact the aerodrome control tower and that control shall be assumed by that unit;
- c. anticipated delay to departing traffic due to congestion.

10.1.5 Coordination between control positions within the same unit

10.1.5.1 Appropriate flight plan and control information shall be exchanged between control positions within the same air traffic control unit, in respect of:

- a. all aircraft for which responsibility for control will be transferred from one control position to another;

- b. aircraft operating in such close proximity to the boundary between control sectors that control of traffic within an adjacent sector may be affected;
- c. all aircraft for which responsibility for control has been delegated by a controller using procedural methods to a controller using an ATS surveillance system, as well as other aircraft affected.

10.1.5.2 Procedures for coordination and transfer of control between control sectors within the same ATC unit shall conform to the procedures applicable to ATC units.

10.1.6 Failure of automated coordination

The failure of automated coordination shall be presented clearly to the controller responsible for coordinating the flight at the transferring unit. This controller shall then facilitate the required coordination using prescribed alternative methods.

10.2 COORDINATION IN RESPECT OF THE PROVISION OF FLIGHT INFORMATION SERVICE AND ALERTING SERVICE

10.2.1 Where this is deemed necessary by the ANSP or authorities, coordination between ATS units providing flight information service in adjacent FIRs shall be effected in respect of IFR and VFR flights, in order to ensure continued flight information service to such aircraft in specified areas or along specified routes. Such coordination shall be effected in accordance with an agreement between the ATS units concerned.

10.2.2 Where coordination of flights is effected in accordance with 10.2.1, this shall include transmission of the following information on the flight concerned:

- a. appropriate items of the current flight plan; and
- b. the time at which last contact was made with the aircraft concerned.

10.2.3 This information shall be forwarded to the ATS unit in charge of the next FIR in which the aircraft will operate prior to the aircraft entering such FIR.

10.2.4 When so required by agreement between the appropriate ATS authorities to assist in the

identification of strayed or unidentified aircraft and thereby eliminate or reduce the need for interception, flight plan and flight progress information for flights along specified routes or portions of routes in close proximity to FIR boundaries shall also be provided to the ATS units in charge of the FIRs adjacent to such routes or portions of routes.

10.2.5 In circumstances where an aircraft has declared minimum fuel or is experiencing an emergency or in any other situation wherein the safety of the aircraft is not assured, the type of emergency and/or the circumstances experienced by the aircraft shall be reported by the transferring unit to the accepting unit and any other ATS unit that may be concerned with the flight and to the associated rescue coordination centres, if necessary.

10.3 COORDINATION BETWEEN AIR TRAFFIC SERVICES UNITS AND AERONAUTICAL TELECOMMUNICATION STATIONS

When so prescribed by the ANSP, ATS units shall ensure that the aeronautical telecommunications stations serving the centres concerned are informed regarding transfers of communications contact by aircraft. Unless otherwise provided, information to be made available shall comprise the identification of the aircraft (including SELCAL code, when necessary), the route or destination (where necessary), and the expected or actual time of communications transfer.

CHAPTER 11

AIR TRAFFIC SERVICES MESSAGES

11.1 CATEGORIES OF MESSAGES

11.1.1 General

In accordance with the requirements in Chapter 10 — *Coordination*, the messages listed below are authorized for transmission via the aeronautical fixed service (including the aeronautical telecommunication network (ATN) and the ATS Message Handling Service (AMHS)/ Aeronautical Fixed Telecommunication Network (AFTN), direct-speech circuits or digital data interchange

between ATS units, and computer-computer circuits, or via the aeronautical mobile service, as applicable. They are classified in categories relating to their use by the air traffic services and providing an approximate indication of their importance.

Note.— The Priority Indicator in parentheses after each type of message is that specified in Annex 10 (Volume II, Chapter 4) for application when the message is transmitted on the AFTN.

11.1.2 Emergency messages

This category comprises:

- a. distress messages and distress traffic, including messages relating to a distress phase (SS);
- b. urgency messages, including messages relating to an alert phase or to an uncertainty phase (DD);
- c. other messages concerning known or suspected emergencies which do not fall under a) or b) above, and radio communication failure messages (FF or higher as required).

11.1.3 Movement and control messages

This category comprises:

- a. movement messages (FF), including:

- i. filed flight plan messages
- ii. delay messages
- iii. modification messages
- iv. flight plan cancellation messages
- v. departure messages
- vi. arrival messages;
- b. coordination messages (FF), including:
 - i. current flight plan messages
 - ii. estimate messages
 - iii. coordination messages
 - iv. acceptance messages
 - v. logical acknowledgement messages;
- c. supplementary messages (FF), including:
 - i. request flight plan messages
 - ii. request supplementary flight plan messages
 - iii. supplementary flight plan messages;
- d. control messages (FF), including:
 - i. clearance messages
 - ii. flow control messages
 - iii. position-report and air-report messages.

11.1.4 Flight information messages

11.1.4.1 This category comprises:

- a. messages containing traffic information (FF);
- b. messages containing meteorological information (FF or GG);
- c. messages concerning the operation of aeronautical facilities (GG);
- d. messages containing essential aerodrome information (GG);
- e. messages concerning air traffic incident reports (FF).

11.1.4.2 When justified by the requirement for special handling, messages transmitted via the AFTN should be assigned the Priority Indicator DD in place of the normal Priority Indicator.

11.2 GENERAL PROVISIONS

Note.— The use in this chapter of expressions such as “originated”, “transmitted”, “addressed” or “received” does not necessarily imply that reference is made to a teletypewriter or digital data interchange for a computer-to-computer message. Except where specifically indicated, the messages described in this chapter may also be transmitted by voice, in which case the four terms above represent “initiated”, “spoken by”, “spoken to” and “listened to” respectively.

11.2.1 Origination and addressing of messages

11.2.1.1 GENERAL

Note.— Movement messages in this context comprise flight plan messages, departure messages, delay messages, arrival messages, cancellation messages and position-report messages and modification messages relevant thereto.

11.2.1.1.1 Messages for ATS purposes shall be originated by the appropriate ATS units or by aircraft as specified in Section 11.3, except that, through special local arrangements, ATS units may delegate the responsibility for originating movement messages to the pilot, the

operator, or its designated representative.

11.2.1.1.2 Origination of movement, control and flight information messages for purposes other than air traffic services (e.g. operational control) shall, except as provided for in CAR 11, 2.16, be the responsibility of the pilot, the operator, or a designated representative.

11.2.1.1.3 Flight plan messages, amendment messages related thereto and flight plan cancellation messages shall, except as provided in 11.2.1.1.4, be addressed only to those ATS units which are specified in the provisions of 11.4.2. Such messages shall be made available to other ATS units concerned, or to specified positions within such units and to any other addressees of the messages, in accordance with local arrangements.

11.2.1.1.4 When so requested by the operator concerned, emergency and movement messages which are to be transmitted simultaneously to ATS units concerned, shall also be addressed to:

- a. one addressee at the destination aerodrome or departure aerodrome; and
- b. not more than two operational control units concerned;

such addressees to be specified by the operator or its designated representative.

11.2.1.1.5 When so requested by the operator concerned, movement messages transmitted progressively between ATS units concerned and relating to aircraft for which operational control service is provided by that operator shall, so far as practicable, be made available immediately to the operator or its designated representative in accordance with agreed local procedures.

11.2.1.2 USE OF THE AFTN

11.2.1.2.1 ATS messages to be transmitted via the AFTN shall contain:

- a. information in respect of the priority with which they are to be transmitted and the addressees to whom they are to be delivered, and an indication of the date and time at which they are filed with the aeronautical fixed station concerned and of the Originator

Indicator (see 11.2.1.2.5);

- b. the ATS data, preceded if necessary by the supplementary address information described in 11.2.1.2.6, and prepared in accordance with Appendix 3. These data will be transmitted as the text of the AFTN message.

11.2.1.2.2 PRIORITY INDICATOR

This shall consist of the appropriate two-letter Priority Indicator as mentioned below for the message as shown in parentheses for the appropriate category of message in Section 11.1.

| Transmission Priority | Priority Indicator |
|-----------------------|--------------------|
| 1 | SS |
| 2 | DD FF |
| 3 | GG KK |

11.2.1.2.3 ADDRESS

11.2.1.2.3.1 This shall consist of a sequence of Addressee Indicators, one for each addressee to whom the message is to be delivered.

11.2.1.2.3.2 Each Addressee Indicator shall consist of an eight-letter sequence comprising, in the following order:

- a. the ICAO four-letter location indicator assigned to the place of destination;

Note.— A list of ICAO location indicators is contained in Doc 7910 — Location Indicators.

- b.

- i. the ICAO three-letter designator identifying the aeronautical authority, service or aircraft operating agency addressed, or
- ii. in cases where no designator has been assigned, one of the following:

— “YXY” in the case where the addressee is a military service/organization,

- “ZZZ” in the case where the addressee is an aircraft in flight,
- “YYY” in all other cases;

Note.— A list of ICAO three-letter designators is contained in Doc 8585 — Designators for Aircraft Operating Agencies, Aeronautical Authorities and Services.

c.

- i. i) the letter X, or
- ii. ii) the one-letter designator identifying the department or division of the organization addressed.

11.2.1.2.3.3 The following three-letter designators shall be used when addressing ATS messages to ATS units:

Centre in charge of a flight information region or an upper flight information region (whether ACC or FIC):

| | |
|---|-----|
| — if the message is relevant to an IFR flight | ZQZ |
| — if the message is relevant to a VFR flight | ZPZ |
| Aerodrome control tower | ZPZ |
| Air traffic services reporting office | ZPZ |

Other three-letter designators for ATS units shall not be used for that purpose.

11.2.1.2.4 FILING TIME

The filing time shall consist of a six-digit date-time group indicating the date and the time of filing the message for transmission with the aeronautical fixed station concerned.

11.2.1.2.5 ORIGINATOR INDICATOR

The Originator Indicator shall consist of an eight-letter sequence, similar to an Addressee

Indicator (see 11.2.1.2.3.2), identifying the place of origin and the organization originating the message.

11.2.1.2.6 SUPPLEMENTARY INFORMATION ON THE ADDRESS AND THE ORIGIN

The following supplementary information is required when, in the Indicators of the Address and/or Origin, the three-letter designators “YXY”, “ZZZ” or “YYY” (see 11.2.1.2.3.2 b) ii)) are used:

- a. the name of the organization or the identity of the aircraft concerned is to appear at the beginning of the text;
- b. the order of such insertions is to be the same as the order of the Addressee Indicators and/or the Originator Indicator;
- c. where there are more than one such insertion, the last should be followed by the word “STOP”;
- d. where there are one or more insertions in respect of Addressee Indicators plus an insertion in respect of the Originator Indicator, the word “FROM” is to appear before that relating to the Originator Indicator.

Note.— Regarding ATS messages received in teletypewriter page-copy form:

- 1) *ATS messages received via the AFTN will have been placed within a communications “envelope” (preceding and following character sequences which are necessary to ensure correct transmission via the AFTN). Even the text of the AFTN message may be received with words or groups preceding and following the ATS text.*
- 2) *The ATS message may then be located by the simple rule that it is preceded by an open bracket, e.g. ‘(’ and followed by a close bracket, e.g. ‘)’.*
- 3) *In some local cases, the teletypewriter machines in use will always print two specific symbols other than open bracket and close bracket on receipt of ATS messages constructed as prescribed in Appendix 3. Such local variants are easily learned and*

are of no consequence.

11.2.2 Preparation and transmission of messages

11.2.2.1 Except as provided for in 11.2.2.2, ATS messages shall be prepared and transmitted with standard texts in a standard format and in accordance with standard data conventions, as and when prescribed in Appendix 3.

11.2.2.2 When messages are exchanged orally between the relevant ATS units, an oral acknowledgement shall constitute evidence of receipt of the message. No confirmation in written form directly between controllers shall therefore be required. The confirmation of coordination via the exchange of messages between automated systems shall be required unless special arrangements have been made between the units concerned.

Note.— See Annex 11, Chapter 6, regarding the requirement for recording of direct-speech communications.

11.3 METHODS OF MESSAGE EXCHANGE

11.2.1 The lead-time requirements of air traffic control and flow control procedures shall determine the method of message exchange to be used for the exchange of ATS data.

11.2.1.2 The method of message exchange shall also be dependent upon the availability of adequate communications channels, the function to be performed, the types of data to be exchanged and the processing facilities at the centres concerned.

11.2.2 Basic flight plan data necessary for flow control procedures shall be furnished at least 60 minutes in advance of the flight. Basic flight plan data shall be provided by either a filed flight plan or a repetitive flight plan submitted by mail in the form of a repetitive flight plan listing form or other media suitable for electronic data-processing systems.

11.2.2.2 Flight plan data submitted in advance of flight shall be updated by time, level and route changes and other essential information as may be necessary.

11.2.3 Basic flight plan data necessary for air traffic control purposes shall be furnished to the first

en-route control centre at least 30 minutes in advance of the flight, and to each successive centre at least 20 minutes before the aircraft enters that centre's area of jurisdiction, in order for it to prepare for the transfer of control.

11.2.4 Except as provided for in 11.3.5, the second en-route centre and each successive centre shall be provided with current data, including updated basic flight plan data, contained in a current flight plan message or in an estimate message supplementing already available updated basic flight plan data.

11.2.5 In areas where automated systems are utilized for the exchange of flight plan data and where these systems provide data for several ACCs, approach control units and/or aerodrome control towers, the appropriate messages shall not be addressed to each individual ATS unit, but only to these automated systems.

Note.— Further processing and distribution of the data to its associated ATS units is the internal task of the receiving system.

11.2.6 Movement messages

Movement messages shall be addressed simultaneously to the first en-route control centre, to all other ATS units along the route of flight which are unable to obtain or process current flight plan data, and to air traffic flow management units concerned.

11.2.7 Coordination and transfer data

11.2.7.2 Progression of a flight between successive control sectors and/or control centres shall be effected by a coordination and transfer dialogue comprising the following stages:

11.2.7.2.3 notification of the flight in order to prepare for coordination as necessary;

11.2.7.2.4 coordination of conditions of transfer of control by the transferring ATC unit;

11.2.7.2.5 coordination, if necessary, and acceptance of conditions of transfer of control by the accepting ATC unit; and

11.2.7.2.6 the transfer of control to the accepting unit.

11.2.7.3 Except as provided for in 11.3.7.3, the notification of the flight shall be by a current flight plan message containing all relevant ATS data or by an estimate message containing the proposed conditions of transfer. An estimate message shall be used only when updated basic flight plan data is already available at the receiving unit, i.e. a filed flight plan message and associated update message(s) have already been sent by the transferring unit.

11.2.7.4 Except as provided for in 11.3.7.5, the coordination dialogue shall be considered to be completed as soon as the proposed conditions contained in the current flight plan message, or in the estimate message or in one or more counterproposals, are accepted by an operational or logical procedure.

11.2.7.5 Except as provided for in 11.3.7.7, unless an operational acknowledgement is received, a Logical Acknowledgement message shall be automatically transmitted by the receiving computer in order to ensure the integrity of the coordination dialogue employing computer-to-computer links.

This message shall be transmitted when the transfer data has been received and processed to the point that it is considered free of syntactic and semantic errors, i.e. the message contains valid information.

11.2.7.6 The transfer of control shall be either explicit or, by agreement between the two units concerned, implicit, i.e. no communication need be exchanged between the transferring and accepting units.

11.2.7.7 When the transfer of control involves exchange of data, the proposal for transfer shall include information derived from an ATS surveillance system, if appropriate. Since the proposal relates to previously accepted coordination data, further coordination shall normally not be required. However, acceptance of the proposed transfer conditions shall be required.

11.2.7.8 In situations where the proposed transfer conditions are no longer acceptable to the accepting unit, further coordination shall be initiated by the accepting unit by proposing alternative acceptable conditions.

11.2.7.9 Transfer of Communication messages may be used as an alternative to Transfer of Control messages. If Transfer of Communication messages are used to instruct a flight to establish communications with the receiving unit and the transfer of control will take place at the control area boundary, or such other time or place, specified in letters of agreement, Transfer of Control messages need not be used.

11.2.7.10 If, after receipt of information derived from an ATS surveillance system, the accepting centre is unable to identify the aircraft immediately, additional communication shall ensue to obtain new surveillance information, if appropriate.

11.2.7.11 When control of the transferred aircraft has been assumed, the accepting unit shall complete the transfer of control dialogue by communicating assumption of control to the transferring unit, unless special arrangements have been made between the units concerned.

11.3.8 Supplementary data

11.2.8.2 When basic flight plan data or supplementary flight plan data are required, request messages shall be addressed to the ATS unit which is most likely to have access to the required data.

Note.— See 11.4.2.4.2 and 11.4.2.4.3 for ATS units to which request messages shall be addressed.

11.2.8.3 If the requested information is available, a filed or a supplementary flight plan message shall be transmitted.

11.4 MESSAGE TYPES AND THEIR APPLICATION

11.4.1 Emergency messages

11.3.1.2 The various circumstances surrounding each known or suspected emergency situation preclude the specification of standard message types to provide for emergency communications, except as described in 11.4.1.2, 11.4.1.3 and 11.4.1.4.

11.3.1.3 ALERTING (ALR) MESSAGES

11.4.1.2.1 When an ATS unit considers that an aircraft is in a state of emergency as defined in Annex 11, Chapter 5, an alerting message shall be transmitted to any ATS unit that may be concerned with the flight and to the associated rescue coordination centres, containing such of the information specified in Appendix 3, Section 1, as is available or can be obtained.

11.4.1.2.2 When so agreed between the ATS units concerned, a communication relating to an emergency phase and originated by a unit employing automatic data-processing equipment may take the form of a modification message (as in 11.4.2.2.4) or a coordination message (as in 11.4.2.3.4 or 11.4.2.4.4), supplemented by a verbal message giving the additional details prescribed for inclusion in an alerting message.

11.3.1.4 RADIO COMMUNICATION FAILURE (RCF) MESSAGES

Note.—Provisions governing the action to be taken in the event of radio communication failure are set forth in CAR 2, 3.6.5.2, and in Chapter 15, Section 15.6 of this document.

11.4.2.3.3 When an ATS unit is aware that an aircraft in its area is experiencing radio communication failure, an RCF message shall be transmitted to all subsequent ATS units along the route of flight which have already received basic flight plan data (FPL or RPL) and to the aerodrome control tower at the destination aerodrome, if basic flight plan data has been previously sent.

11.4.2.3.4 If the next ATS unit has not yet received basic flight plan data because it would receive a current flight plan message in the coordination procedure, then an RCF message and a current flight plan (CPL) message shall be transmitted to this ATS unit. In turn, this ATS unit shall transmit an RCF message and a CPL message to the next ATS unit.

11.4.2 Movement and control messages

11.4.2.1 GENERAL

Messages concerning the intended or actual movement of aircraft shall be based on the

latest information furnished to ATS units by the pilot, the operator or its designated representative, or derived from an ATS surveillance system.

11.4.2.2 MOVEMENT MESSAGES

11.4.2.2.1. Movement messages comprise:

- filed flight plan messages (11.4.2.2.2)
- delay messages (11.4.2.2.3)
- modification messages (11.4.2.2.4)
- flight plan cancellation messages (11.4.2.2.5)
- departure messages (11.4.2.2.6)
- arrival messages (11.4.2.2.7).

11.4.2.2.2. FILED FLIGHT PLAN (FPL) MESSAGES

Note.— Instructions for the transmission of an FPL message are contained in Appendix 2.

11.4.2.2.2.1. Unless repetitive flight plan procedures are being applied or current flight plan messages are being employed, filed flight plan messages shall be transmitted for all flights for which a flight plan has been submitted with the object of being provided with air traffic control service, flight information service or alerting service along part or the whole of the route of flight.

11.4.2.2.2.2. A filed flight plan message shall be originated and addressed as follows by the ATS unit serving the departure aerodrome or, when applicable, by the ATS unit receiving a flight plan from an aircraft in flight:

- a. an FPL message shall be sent to the ACC or flight information centre serving the control area or FIR within which the departure aerodrome is situated;
- b. unless basic flight plan data are already available as a result of arrangements made

for repetitive flight plans, an FPL message shall be sent to all centres in charge of each FIR or upper FIR along the route which are unable to process current data. In addition, an FPL message shall be sent to the aerodrome control tower at the destination aerodrome. If so required, an FPL message shall also be sent to flow management centres responsible for ATS units along the route;

- c. when a potential re-clearance in flight (RIF) request is indicated in the flight plan, the FPL message shall be sent to the additional centres concerned and to the aerodrome control tower of the revised destination aerodrome;
- d. where it has been agreed to use CPL messages but where information is required for early planning of traffic flow, an FPL message shall be transmitted to the ACCs concerned;
- e. for a flight along routes where flight information service and alerting service only are provided, an FPL message shall be addressed to the centre in charge of each FIR or upper FIR along the route and to the aerodrome control tower at the destination aerodrome.

11.4.2.2.2.3. In the case of a flight through intermediate stops, where flight plans for each stage of the flight are filed at the first departure aerodrome, the following procedure shall be applied:

- a. the air traffic services reporting office at the first departure aerodrome shall:
 - i. transmit an FPL message for the first stage of flight in accordance with 11.4.2.2.2.2;
 - ii. transmit a separate FPL message for each subsequent stage of flight, addressed to the air traffic services reporting office at the appropriate subsequent departure aerodrome;
- b. the air traffic services reporting office at each subsequent departure aerodrome shall take action on receipt of the FPL message as if the flight plan has been filed locally.

11.4.2.2.2.4. When so required by agreement between the appropriate ATS authorities to assist in the identification of flights and thereby eliminate or reduce the need for interceptions in the event of deviations from assigned track, FPL messages for flights along specified routes or portions of routes in close proximity to FIR boundaries shall also be addressed to the centres in charge of each FIR or upper FIR adjacent to such routes or portions of routes.

11.4.2.2.2.5. FPL messages should be transmitted immediately after the filing of the flight plan. If a flight plan is filed more than 24 hours in advance of the estimated off-block time of the flight to which it refers, the date of the flight departure shall be inserted in Item 18 of the flight plan.

11.4.2.2.3. DELAY (DLA) MESSAGES

11.4.2.2.3.1. A DLA message shall be transmitted when the departure of an aircraft, for which basic flight plan data (FPL or RPL) has been sent, is delayed by more than 30 minutes after the estimated off-block time contained in the basic flight plan data.

11.4.2.2.3.2. The DLA message shall be transmitted by the ATS unit serving the departure aerodrome to all recipients of basic flight plan data.

Note.— See 11.4.2.3.4 concerning notification of a delayed departure of an aircraft for which a CPL message has been transmitted.

11.4.2.2.4. MODIFICATION (CHG) MESSAGES

A CHG message shall be transmitted when any change is to be made to basic flight plan data contained in previously transmitted FPL or RPL data. The CHG message shall be sent to those recipients of basic flight plan data which are affected by the change. Relevant revised basic flight plan data shall be provided to such affected entities not previously having received this.

Note.— See 11.4.2.3.4 concerning notification of a change to coordination data contained in a previously transmitted current flight plan or estimate message.

11.4.2.2.5. FLIGHT PLAN CANCELLATION (CNL) MESSAGES

A flight plan cancellation (CNL) message shall be transmitted when a flight, for which basic flight plan data has been previously distributed, has been cancelled. The ATS unit serving the departure aerodrome shall transmit the CNL message to ATS units which have received basic flight plan data.

11.4.2.2.6. DEPARTURE (DEP) MESSAGES

11.4.2.2.6.1. Unless otherwise prescribed on the basis of regional air navigation agreements, a DEP message shall be transmitted immediately after the departure of an aircraft for which basic flight plan data have been previously distributed.

11.4.2.2.6.2. The DEP message shall be transmitted by the ATS unit serving the departure aerodrome to all recipients of basic flight plan data.

Note.— See 11.4.2.3.4 concerning notification of the departure of an aircraft for which a CPL message has been transmitted.

11.4.2.2.7. ARRIVAL (ARR) MESSAGES

11.4.2.2.7.1. When an arrival report is received by the ATS unit serving the arrival aerodrome, this unit shall transmit an ARR message:

- a. for a landing at the destination aerodrome:
 - i. to the ACC or flight information centre in whose area the arrival aerodrome is located, if required by that unit; and
 - ii. to the ATS unit, at the departure aerodrome, which originated the flight plan message, if that message included a request for an ARR message;
- b. for a landing at an alternate or other aerodrome:
 - i. to the ACC or flight information centre in whose area the arrival aerodrome is located; and

- ii. to the aerodrome control tower at the destination aerodrome; and
- iii. to the air traffic services reporting office at the departure aerodrome; and
- iv. to the ACC or flight information centre in charge of each FIR or upper FIR through which the aircraft would have passed according to the flight plan, had it not diverted.

11.4.2.2.7.2. When a controlled flight which has experienced failure of two-way communication has landed, the aerodrome control tower at the arrival aerodrome shall transmit an ARR message:

- a. for a landing at the destination aerodrome:
 - i. to all ATS units concerned with the flight during the period of the communication ; and
 - ii. to all other ATS units which may have been alerted;
- b. for a landing at an aerodrome other than the destination aerodrome:

to the ATS unit serving the destination aerodrome; this unit shall then transmit an ARR message to other ATS units concerned or alerted as in a) above.

11.4.2.3 COORDINATION MESSAGES (APPENDIX 3 REFERS)

Note.— The provisions governing coordination are contained in Chapter 10. Phraseology to be used in voice communication is contained in Chapter 12. See paragraph 11.4.2.5 below for the provisions governing AIDC messages, as prescribed in Appendix 6.

11.4.2.3.1 Coordination messages comprise:

- current flight plan messages (11.4.2.3.2)
- estimate messages (11.4.2.3.3)
- coordination messages (11.4.2.3.4)

- acceptance messages (11.4.2.3.5)
- logical acknowledgement messages (11.4.2.3.6).

11.4.2.3.2 CURRENT FLIGHT PLAN (CPL) MESSAGES

11.4.2.3.2.1. Unless basic flight plan data have already been distributed (FPL or RPL) which will be supplemented by coordination data in the estimate message, a CPL message shall be transmitted by each ACC to the next ACC and from the last ACC to the aerodrome control tower at the destination aerodrome, for each controlled flight, and for each flight provided with air traffic advisory service along routes or portions of routes where it has been determined by the appropriate ATS authority that adequate point-to-point communications exist and that conditions are otherwise suitable for forwarding current flight plan information.

11.4.2.3.2.2. When an aircraft traverses a very limited portion of a control area where, by agreement between the appropriate ATS authorities concerned, coordination of air traffic through that portion of the control area has been delegated to and is effected directly by the two centres whose control areas are separated by that portion, CPLs shall be transmitted directly between such units.

11.4.2.3.2.3. A CPL message shall be transmitted in sufficient time to permit each ATS unit concerned to receive the information at least 20 minutes before the time at which the aircraft is estimated to pass the transfer of control point or boundary point at which it comes under the control of such unit, unless another period of time has been prescribed by the appropriate ATS authority. This procedure shall apply whether or not the ATS unit responsible for origination of the message has assumed control of, or established contact with, the aircraft by the time the transmission is to be effected.

11.4.2.3.2.4. When a CPL message is transmitted to a centre which is not using automatic data processing equipment, the period of time specified in 11.4.2.3.2.3 may be insufficient, in which case an increased lead-time shall be agreed.

11.4.2.3.2.5. A CPL message shall include only information concerning the flight from the

point of entry into the next control area or advisory airspace to the destination aerodrome.

11.4.2.3.3 ESTIMATE (EST) MESSAGES

11.4.2.3.3.1. When basic flight plan data for a flight has been provided, an EST message shall be transmitted by each ACC or flight information centre to the next ACC or flight information centre along the route of flight.

11.4.2.3.3.2. An EST message shall be transmitted in sufficient time to permit the ATS unit concerned to receive the information at least 20 minutes before the time at which the aircraft is estimated to pass the transfer of control point or boundary point at which it comes under the control of such unit, unless another period of time has been prescribed by the ANSP. This procedure shall apply whether or not the ACC or flight information centre responsible for origination of the message has assumed control of, or established contact with, the aircraft by the time the transmission is to be effected.

11.4.2.3.3.3. When an EST message is transmitted to a centre which is not using automatic data processing equipment, the period of time specified in 11.4.2.3.3.2 may be insufficient, in which case an increased lead-time shall be agreed.

11.4.2.3.4 COORDINATION (CDN) MESSAGES

11.4.2.3.4.1. A CDN message shall be transmitted during the coordination dialogue by an accepting unit to the transferring unit when the former wishes to propose a change to coordination data as contained in a previously received CPL or EST message.

11.4.2.3.4.2. If the transferring unit wishes to propose a change to the data contained in a CDN message received from the accepting unit, a CDN message shall be transmitted to the accepting unit.

11.4.2.3.4.3. The dialogue described above is repeated until the coordination dialogue is completed by the transmission of an acceptance (ACP) message by one of the two units concerned. Normally, however, when a change is proposed to a CDN message, direct-speech circuits shall be used to resolve this issue.

11.4.2.3.4.4. After the coordination dialogue has been completed, if one of the two ATS units concerned wishes to propose or notify any change in basic flight plan data or conditions of transfer, a CDN message shall be transmitted to the other unit. This requires that the coordination dialogue be repeated.

11.4.2.3.4.5. A repeated coordination dialogue is completed by the transmission of an ACP message. Normally, in a repeated coordination dialogue, direct-speech circuits shall be used.

11.4.2.3.5 ACCEPTANCE (ACP) MESSAGES

11.4.2.3.5.1. Unless special arrangements have been made between the air traffic control units concerned in accordance with Chapter 10, 10.1.2.2.1, an ACP message shall be transmitted by an accepting unit to the transferring unit to indicate that data in a CPL or an EST message is accepted.

11.4.2.3.5.2. Either the accepting unit or the transferring unit shall transmit an ACP message to indicate that data received in a CDN message is accepted and that the coordination dialogue is completed.

11.4.2.3.6 LOGICAL ACKNOWLEDGEMENT MESSAGES (LAM)

11.4.2.3.6.1. An LAM shall be used only between ATC computers.

11.4.2.3.6.2. An ATC computer shall transmit an LAM in response to a CPL or EST or other appropriate message which is received and processed up to the point where the operational content will be received by the appropriate controller.

11.4.2.3.6.3. The transferring centre shall set an appropriate reaction time parameter when the CPL or EST message is transmitted. If the LAM is not received within the parameter time, an operational warning shall be initiated and reversion to telephone and manual mode shall ensue.

11.4.2.4 SUPPLEMENTARY MESSAGES

11.4.2.4.1 Supplementary messages comprise:

- request flight plan messages(11.4.2.4.2)
- request supplementary flight plan messages (11.4.2.4.3)
- supplementary flight plan messages(11.4.2.4.4).

11.4.2.4.2 REQUEST FLIGHT PLAN (RQP) MESSAGES

A request flight plan (RQP) message shall be transmitted when an ATS unit wishes to obtain flight plan data. This might occur upon receipt of a message concerning an aircraft for which no corresponding basic flight plan data had been previously received. The RQP message shall be transmitted to the transferring ATS unit which originated an EST message, or to the centre which originated an update message for which no corresponding basic flight plan data are available. If no message has been received at all, but an aircraft establishes radiotelephony (RTF) communications and requires air traffic services, the RQP message shall be transmitted to the previous ATS unit along the route of flight.

11.4.2.4.3 REQUEST SUPPLEMENTARY FLIGHT PLAN (RQS) MESSAGES

A request supplementary flight plan (RQS) message shall be transmitted when an ATS unit wishes to obtain supplementary flight plan data. The message shall be transmitted to the air traffic services reporting office at the departure aerodrome or in the case of a flight plan submitted during flight, to the ATS unit specified in the flight plan message.

11.4.2.4.4 SUPPLEMENTARY FLIGHT PLAN (SPL) MESSAGES

Note.— Instructions for the transmission of an SPL are contained in Appendix 2.

An SPL message shall be transmitted by the ATS reporting office at the departure aerodrome to ATS units requesting information additional to that already transmitted in a CPL or FPL message. When transmitted by the AFTN, the message shall be assigned the same priority indicator as that in the request message.

11.4.2.5 CONTROL MESSAGES

11.4.2.5.1 Control messages comprise:

- clearance messages (11.4.2.6.2)
- flow control messages (11.4.2.6.3)
- position-report and air-report messages (11.4.2.6.4).

11.4.2.5.2 FLOW CONTROL MESSAGES

Note.— Provisions governing the control of air traffic flow are set forth in CAR 11, 3.7.5 and in Chapter 3, 3.2.5.2 of this document. Attention drawn, however, to the guidance material contained in the manual on Collaborative Air Traffic Flow Management (Doc. 9971)

11.4.2.5.2.1 Clearances shall contain the following in the order listed:

- a. aircraft identification;
- b. clearance limit;
- c. route of flight;
- d. level(s) of flight for the entire route or part thereof and changes of levels if required;

Note.— If the clearance for the levels covers only part of the route, it is important for the air traffic control unit to specify a point to which the part of the clearance regarding levels applies whenever necessary to ensure compliance with 3.6.5.2.2 a) of CAR 2.

- e. any necessary instructions or information on other matters such as SSR transponder operation, approach or departure manoeuvres, communications and the time of expiry of the clearance.

Note.— The time of expiry of the clearance indicates the time after which the clearance will be automatically cancelled if the flight has not been started.

11.4.2.5.2.2 Instructions included in clearances relating to levels shall consist of:

- a. cruising level(s) or, for cruise climb, a range of levels, and, if necessary, the point to which the clearance is valid with regard to the level(s);

Note.— See 11.4.2.6.2.1 d) and associated Note.

- b. levels at which specified significant points are to be crossed, when necessary;
- c. the place or time for starting climb or descent, when necessary;
- d. the rate of climb or descent, when necessary;
- e. detailed instructions concerning departure or approach levels, when necessary.

11.4.2.5.2.3 It is the responsibility of the aeronautical station or aircraft operator who has received the clearance to transmit it to the aircraft at the specified or expected delivery time, and to notify the air traffic control unit promptly if it is not delivered within a specified period of time.

11.4.2.5.2.4 Personnel receiving clearances for transmission to aircraft shall transmit such clearances in the exact phraseology in which they are received. In those cases where the personnel transmitting the clearances to the aircraft do not form part of the air traffic services, it is essential that appropriate arrangements be made to meet this requirement.

11.4.2.5.2.5 Level restrictions issued by ATC in air-ground communications shall be repeated in conjunction with subsequent level clearances in order to remain in effect.

Note.— See also Chapter 6, 6.3.2.4 and 6.5.2.4, regarding level restrictions published as elements of SIDs and STARs.

11.4.2.5.3 POSITION-REPORT AND AIR-REPORT MESSAGES

Note.— Provisions governing position reporting are set forth in Annex 2, 3.6.3 and 5.3.3, and in Chapter 4, Sections 4.11 and 4.12 of this document.

11.4.2.5.3.1 The format and data conventions to be used in position-report and special air-report messages are those specified on the model AIREP SPECIAL form at Appendix 1,

using:

- a. for position-report messages: Section 1;
- b. for special air-report messages: Section 1 followed by Sections 2 and/or 3 as relevant.

11.4.2.5.3.2 Where special air-report messages transmitted by voice communications are subsequently forwarded by automatic data-processing equipment which cannot accept the special air-report message type designator ARS, the use of a different message-type designator shall be permitted by regional air navigation agreement and should be reflected in the *Regional Supplementary Procedures* (Doc 7030) provided that:

- a. the data transmitted accord with that specified in the special air-report format; and
- b. measures are taken to ensure that special air-report messages are forwarded to the appropriate meteorological unit and to other aircraft likely to be affected.

11.4.3 Flight information messages

11.4.3.1 MESSAGES CONTAINING TRAFFIC INFORMATION

Note.— Provisions governing the issuance of traffic information are set forth in CAR 11, 4.2.2 b) and Notes 1 and 2 and in Chapter 5, Section 5.10, and Chapter 7, Section 7.4.1 of this document.

11.4.3.1.1 MESSAGES CONTAINING TRAFFIC INFORMATION TO AIRCRAFT OPERATING OUTSIDE CONTROLLED AIRSPACE

11.4.3.1.1.1 Due to the factors influencing the nature of the flight information services, and particularly the question of provision of information on possible collision hazards to aircraft operating outside controlled airspace, it is not possible to specify standard texts for these messages.

11.4.3.1.1.2 Where such messages are transmitted they shall, however, contain sufficient data on the direction of flight and the estimated time, level and point at which the aircraft involved in the possible collision hazard will pass, overtake or approach each other.

This information shall be given in such a way that the pilot of each aircraft concerned is able to appreciate clearly the nature of the hazard.

11.4.3.1.2 MESSAGES CONTAINING ESSENTIAL TRAFFIC INFORMATION TO IFR FLIGHTS OUTSIDE CONTROLLED AIRSPACE

Whenever such messages are transmitted they shall contain the following text:

- a. identification of the aircraft to which the information is transmitted;
- b. the words TRAFFIC IS or ADDITIONAL TRAFFIC IS;
- c. direction of flight of aircraft concerned;
- d. type of aircraft concerned;
- e. cruising level of aircraft concerned and ETA for the significant point nearest to where the aircraft will cross levels.

11.4.3.1.3 MESSAGES CONTAINING ESSENTIAL LOCAL TRAFFIC INFORMATION

Whenever such messages are transmitted they shall contain the following text:

- a. identification of the aircraft to which the information is transmitted;
- b. the words TRAFFIC IS or ADDITIONAL TRAFFIC IS, if necessary;
- c. description of the essential local traffic in terms that will facilitate recognition of it by the pilot, e.g. type, speed category and/or colour of aircraft, type of vehicle, number of persons;
- d. position of the essential local traffic relative to the aircraft concerned, and direction of movement.

11.4.3.2 MESSAGES CONTAINING METEOROLOGICAL INFORMATION

11.4.3.2.1 Information to a pilot changing from IFR flight to VFR flight where it is likely that flight in VMC cannot be maintained shall be given in the following manner:

“INSTRUMENT METEOROLOGICAL CONDITIONS REPORTED (or forecast) IN THE VICINITY OF (location)”.

11.4.3.2.2 Meteorological information concerning the meteorological conditions at aerodromes, to be transmitted to aircraft by the ATS unit concerned, in accordance with CAR 11, Chapter 4 and this document, Chapter 6, Sections 6.4 and 6.6 and Chapter 7, Section 7.4.1, shall be extracted by the ATS unit concerned from the following meteorological messages, provided by the appropriate meteorological office, supplemented for arriving and departing aircraft, as appropriate, by information from displays relating to meteorological sensors (in particular, those related to the surface wind and runway visual range) located in the ATS units:

- a. local meteorological routine and special reports;
- b. METAR/SPECI, for dissemination to other aerodromes beyond the aerodrome of origin (mainly intended for flight planning, VOLMET broadcasts and D-VOLMET).

11.4.3.2.3 The meteorological information referred to in 11.4.3.2.2 shall be extracted, as appropriate, from meteorological reports providing information on the following elements:

- a. mean surface wind direction and speed and significant variations therefrom;

Note.— Information on surface wind direction provided to ATS units by the associated meteorological office is referenced to degrees true North. Information on surface wind direction obtained from the ATS surface wind indicator and passed to pilots by ATS units is given in degrees magnetic.

- b. visibility, including significant directional variations;
- c. runway visual range (RVR);
- d. present weather;

- e. amount and height of base of low cloud;
- f. air temperature and dew-point temperature;
- g. altimeter setting(s); and
- h. supplementary information.

Note. — Provisions relating to meteorological information to be provided in accordance with 11.4.3.2.3 are contained in Annex 3 — Meteorological Service for International Air Navigation, Chapter 4 and Appendix 3.

11.4.3.3 MESSAGES CONCERNING THE OPERATION OF AERONAUTICAL FACILITIES

Note.— General provisions concerning this subject are set forth in CAR 11, 4.2.

Messages concerning the operation of aeronautical facilities shall be transmitted to aircraft from whose flight plan it is apparent that the operation of the flight may be affected by the operating status of the operating facility concerned. They shall contain appropriate data on the service status of the facility in question, and, if the facility is out of operation, an indication when the normal operating status will be restored.

11.4.3.4 MESSAGES CONTAINING INFORMATION ON AERODROME CONDITIONS

Note.— Provisions regarding the issuance of information on aerodrome conditions are contained in Chapter 7, 7.5.

11.4.3.4.1 Whenever information is provided on aerodrome conditions, this shall be done in a clear and concise manner so as to facilitate appreciation by the pilot of the situation described. It shall be issued whenever deemed necessary by the controller on duty in the interest of safety, or when requested by an aircraft. If the information is provided on the initiative of the controller, it shall be transmitted to each aircraft concerned in sufficient time to enable the pilot to make proper use of the information.

11.4.3.4.2 Whenever information is provided concerning runway surface conditions that may adversely affect aircraft braking action, the following terms shall be used, as necessary:

- COMPACTED SNOW
- DRY
- DRY SNOW
- DRY SNOW ON TOP OF COMPACTED SNOW
- DRY SNOW ON TOP OF ICE
- FROST
- ICE
- SLUSH
- STANDING WATER
- WATER ON TOP OF COMPACTED SNOW
- WET
- WET ICE
- WET SNOW
- WET SNOW ON TOP OF COMPACTED SNOW
- WET SNOW ON TOP OF ICE

11.4.3.4.3 Appropriate ATS units shall have available for transmission to aircraft, upon request, the runway condition report (RCR) information. This shall be passed to aircraft in the order of the direction of landing or take-off.

11.4.3.5 MESSAGES CONCERNING AIR TRAFFIC INCIDENT REPORTS

When an aircraft involved in an incident has a destination outside the area of responsibility of the ATS unit where the incident occurred, the ATS unit at the destination aerodrome should be notified and requested to obtain the pilot's report. The following information should be included in the message:

- a. type of incident (AIRPROX, procedure or facility);
- b. identification of the aircraft concerned;
- c. time and position at time of incident;
- d. brief details of incident.

CHAPTER 12

PHRASEOLOGIES

12.1 COMMUNICATIONS PROCEDURES

The communications procedures shall be in accordance with Volume II of Annex10 — *Aeronautical Telecommunications*, and pilots, ATS personnel and other ground personnel shall be thoroughly familiar with the radiotelephony procedures contained therein.

12.2 GENERAL

Note.— Requirements for read back of clearances and safety-related information are provided in Chapter 4, 4.5.7.5.

12.2.1 Most phraseologies contained in Section 12.3 of this Chapter show the text of a complete message without call signs. They are not intended to be exhaustive, and when circumstances differ, pilots, ATS personnel and other ground personnel will be expected to use plain language, which should be as clear and concise as possible, to the level specified in the ICAO language proficiency requirements contained in PELR, in order to avoid possible confusion by those persons using a language other than one of their national languages.

12.2.2 The phraseologies are grouped according to types of air traffic service for convenience of reference. However, users shall be familiar with, and use as necessary, phraseologies from groups other than those referring specifically to the type of air traffic service being provided. All phraseologies shall be used in conjunction with call signs (aircraft, ground vehicle, ATC or other) as appropriate. In order that the phraseologies listed should be readily discernible in Section 12.3, call signs have been omitted. Provisions for the compilation of RTF messages, call signs and procedures are contained in Annex 10, Volume II, Chapter 5.

12.2.3 Section 12.3 includes phrases for use by pilots, ATS personnel and other ground personnel.

12.2.4 During operations in or vertical transit through reduced vertical separation minimum (RVSM) airspace with aircraft not approved for RVSM operations, pilots shall report non-approved status

in accordance with 12.3.1.12 c) as follows:

- a. at initial call on any channel within RVSM airspace;
- b. in all requests for level changes; and
- c. in all read backs of level clearances.

12.2.5 Air traffic controllers shall explicitly acknowledge receipt of messages from aircraft reporting RVSM non-approved status.

12.2.6 Phraseologies for the movement of vehicles, on the manoeuvring area shall be the same as those used for the movement of aircraft, with the exception of taxi instructions, in which case the word “PROCEED” shall be substituted for the word “TAXI” when communicating with vehicles.

12.2.7 Conditional phrases, such as “behind landing aircraft” or “after departing aircraft”, shall not be used for movements affecting the active runway(s), except when the aircraft or vehicles concerned are seen by the appropriate controller and pilot. The aircraft or vehicle causing the condition in the clearance issued shall be the first aircraft/vehicle to pass in front of the other aircraft concerned. In all cases a conditional clearance shall be given in the following order and consist of:

- a. identification;
- b. the condition;
- c. the clearance; and
- d. brief reiteration of the condition,

for example:

“RNA206, BEHIND A319 ON SHORT FINAL, LINE UP BEHIND”.

Note.— This implies the need for the aircraft receiving the conditional clearance to identify the aircraft or vehicle causing the conditional clearance.

12.2.8 The phraseology in Section 12.3 does not include phrases and regular radiotelephony procedure words contained in Annex 10, Volume II.

12.2.9 Words in parentheses indicate that specific information, such as a level, a place or a time, etc., must be inserted to complete the phrase, or alternatively that optional phrases may be used. Words in square parentheses indicate optional additional words or information that may be necessary in specific instances.

12.2.10 Examples of the application of the phraseologies may be found in the *Manual of Radiotelephony* (Doc 9432).

12.3 ATC PHRASEOLOGIES

12.3.1 General

| <i>Circumstances</i> | <i>Phraseologies</i> |
|---|--|
| 12.3.1.1 DESCRIPTION OF LEVELS (SUBSEQUENTLY REFERRED TO AS “(LEVEL)”) | a) FLIGHT LEVEL (<i>number</i>); <i>or</i> b) (<i>number</i>) METRES; <i>or</i> c) (<i>number</i>) FEET. |
| 12.3.1.2 LEVEL CHANGES, REPORTS AND RATES ... instruction that a climb (or descent) to a level within the vertical range defined is to commence | a) CLIMB (<i>or</i> DESCEND); <i>followed as necessary by:</i> 1) TO (<i>level</i>); 2) TO AND MAINTAIN BLOCK (<i>level</i>) TO (<i>level</i>); 3) TO REACH (<i>level</i>) AT (<i>or BY</i>) (<i>time or</i> <i>significant point</i>); 4) REPORT LEAVING (<i>or</i> REACHING, <i>or</i> PASSING) (<i>level</i>); 5) AT (<i>number</i>) METRES PER SECOND (<i>or</i> FEET PER MINUTE) [OR GREATER (<i>or</i> OR |

| | |
|---|--|
| | LESS)]; |
| ... for SST aircraft only | 6) REPORT STARTING ACCELERATION (<i>or</i> DECELERATION). b) MAINTAIN AT LEAST (<i>number</i>) METRES (<i>or</i> FEET) ABOVE (<i>or</i> BELOW) (<i>aircraft call sign</i>); c) REQUEST LEVEL (<i>or</i> FLIGHT LEVEL <i>or</i> ALTITUDE) CHANGE FROM (<i>name of unit</i>) [AT (<i>time or significant point</i>)]; d) STOP CLIMB (<i>or</i> DESCENT) AT (<i>level</i>); e) CONTINUE CLIMB (<i>or</i> DESCENT) TO (<i>level</i>); f) EXPEDITE CLIMB (<i>or</i> DESCENT) [UNTIL PASSING (<i>level</i>)]; g) WHEN READY CLIMB (<i>or</i> DESCEND) TO (<i>level</i>); h) EXPECT CLIMB (<i>or</i> DESCENT) AT (<i>time or significant point</i>); i) *REQUEST DESCENT AT (<i>time</i>); |
| ... to require action at a specific time or place | j) IMMEDIATELY; k) AFTER PASSING (<i>significant point</i>); l) AT (<i>time or significant point</i>); |
| ... to require action when convenient | m) WHEN READY (<i>instruction</i>); |
| ... to require an aircraft to climb or descend maintaining own separation and VMC | n) MAINTAIN OWN SEPARATION AND VMC [FROM (<i>level</i>)] [TO (<i>level</i>)]; o) MAINTAIN OWN SEPARATION AND VMC ABOVE (<i>or</i> BELOW, <i>or</i> TO) (<i>level</i>); |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|--|
| ... when there is doubt that an aircraft can comply with a clearance or instruction | p) IF UNABLE (<i>alternative instructions</i>) AND ADVISE; |
| ... when a pilot is unable to comply with a clearance or instruction | q) *UNABLE; |
| ... after a flight crew starts to deviate from any ATC clearance or instruction to comply with an ACAS resolution advisory (RA) (Pilot and controller interchange) | r) *TCAS RA; s) ROGER; |
| ... after the response to an ACAS RA is completed and a return to the ATC clearance or instruction is initiated (Pilot and controller interchange) | t) *CLEAR OF CONFLICT, RETURNING TO (<i>assigned clearance</i>); u) ROGER (<i>or alternative instructions</i>); |
| ... after the response to an ACAS RA is completed and the assigned ATC clearance or instruction has been resumed (Pilot and controller interchange) | v) *CLEAR OF CONFLICT (<i>assigned clearance</i>) RESUMED; w) ROGER (<i>or alternative instructions</i>); |
| ... after an ATC clearance or instruction contradictory to the ACAS RA is received, the flight crew will follow the RA and inform ATC directly (Pilot and controller interchange) | x) *UNABLE, TCAS RA; y) ROGER; |
| ... clearance to climb on a SID which has published level and/or speed restrictions, where the pilot is to climb to the cleared level and comply with published level restrictions, follow the lateral profile of the SID and comply with published speed restrictions or ATC issued speed control instructions as applicable. | z) CLIMB VIA SID TO (<i>level</i>). |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|---|
| ... clearance to cancel level restriction(s) of the vertical profile of a SID during climb | aa) [CLIMB VIA SID TO <i>(level)</i>], CANCEL LEVEL RESTRICTION(S); |
| ... clearance to cancel specific level restriction(s) of the vertical profile of a SID during climb | bb) [CLIMB VIA SID TO <i>(level)</i>], CANCEL LEVEL RESTRICTION(S) AT <i>(point(s))</i> ; |
| ... clearance to cancel speed restrictions of a SID during climb | cc)) [CLIMB VIA SID TO <i>(level)</i>], CANCEL SPEED RESTRICTION(S); |
| ... clearance to cancel specific speed restrictions of a SID during climb | dd) [CLIMB VIA SID TO <i>(level)</i>], CANCEL SPEED RESTRICTION(S) AT <i>(point(s))</i> ; |
| ... clearance to climb and to cancel speed and level restrictions of a SID | ee) CLIMB UNRESTRICTED TO <i>(level)</i> (<i>or</i>) CLIMB TO <i>(level)</i> , CANCEL LEVEL AND SPEED RESTRICTIONS; |
| ... clearance to descend on a STAR which has published level and/or speed restrictions, where the pilot is to descend to the cleared level and comply with published level restrictions, follow the lateral profile of the STAR and comply with published speed restrictions or ATC issued speed control instructions. | ff) DESCEND VIA STAR TO <i>(level)</i> ; |
| ... clearance to cancel level restrictions of a STAR during descent | gg) [DESCEND VIA STAR TO <i>(level)</i>], CANCEL LEVEL RESTRICTION(S); |

| | |
|---|--|
| ... clearance to cancel specific level restrictions of a STAR during descent | hh) [DESCEND VIA STAR TO <i>(level)</i>], CANCEL LEVEL RESTRICTION(S) AT <i>(point(s))</i> ; |
| ... clearance to cancel speed restrictions of a STAR during descent | ii) [DESCEND VIA STAR TO <i>(level)</i>], CANCEL SPEED RESTRICTION(S); |
| ... clearance to cancel specific speed restrictions of a STAR during descent | jj) [DESCEND VIA STAR TO <i>(level)</i>], CANCEL SPEED RESTRICTION(S) AT <i>(point(s))</i> ; |
| ... clearance to descend and to cancel speed and level restrictions of a STAR | kk) DESCEND UNRESTRICTED TO <i>(level)</i> or DESCEND TO <i>(level)</i> , CANCEL LEVEL AND SPEED RESTRICTIONS. * Denotes pilot transmission. |
| 12.3.1.3 MINIMUM FUEL | |
| ... indication of minimum fuel | a) * MINIMUM FUEL; b) ROGER [NO DELAY EXPECTED <i>or</i> EXPECT <i>(delay information)</i>]. * Denotes pilot transmission. |
| 12.3.1.4 TRANSFER OF CONTROL AND/OR FREQUENCY CHANGE | a) CONTACT <i>(unit call sign) (frequency)</i> [NOW]; b) AT <i>(or OVER) (time or place)</i> [<i>or</i> WHEN] [PASSING/LEAVING/REACHING <i>(level)</i>] CONTACT <i>(unit call sign) (frequency)</i> ; c) IF NO CONTACT <i>(instructions)</i> ; |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|---|
| <p><i>Note.— An aircraft may be requested to “STAND BY” on a frequency when it is intended that the ATS unit will initiate communications soon and to “MONITOR” a frequency when information is being broadcast thereon.</i></p> | <p>d) STAND BY FOR (unit call sign) (frequency);</p> <p>e) *REQUEST CHANGE TO (frequency);</p> <p>f) FREQUENCY CHANGE APPROVED;</p> <p>g) MONITOR (unit call sign) (frequency);</p> <p>h) *MONITORING (frequency);</p> <p>i) WHEN READY CONTACT (unit call sign) (frequency);</p> <p>j) REMAIN THIS FREQUENCY.</p> <p>* Denotes pilot transmission.</p> |
| <p>12.3.1.5 8.33 KHZ CHANNEL SPACING</p> <p><i>Note.— In this paragraph, the term “point” is used only in the context of naming the 8.33 kHz channel spacing concept and does not constitute any change to existing ICAO provisions or phraseology regarding the use of the term “decimal”.</i></p> <p>... to request confirmation of 8.33 kHz capability</p> <p>... to indicate 8.33 kHz capability</p> <p>... to indicate lack of 8.33 kHz capability</p> <p>... to request UHF capability</p> <p>... to indicate UHF capability</p> <p>... to indicate lack of UHF capability</p> | <p>a) CONFIRM EIGHT POINT THREE THREE;</p> <p>b) *AFFIRM EIGHT POINT THREE THREE;</p> <p>c) *NEGATIVE EIGHT POINT THREE THREE;</p> <p>d) CONFIRM UHF;</p> <p>e) *AFFIRM UHF;</p> <p>f) *NEGATIVE UHF;</p> |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|---|
| ... to request status in respect of 8.33 kHz exemption | g) CONFIRM EIGHT POINT THREE THREE EXEMPTED; |
| ... to indicate 8.33 kHz exempted status | h) *AFFIRM EIGHT POINT THREE THREE EXEMPTED; |
| ... to indicate 8.33 kHz non-exempted status | i) *NEGATIVE EIGHT POINT THREE THREE EXEMPTED; |
| ... to indicate that a certain clearance is given because otherwise a non-equipped and/or non-exempted aircraft would enter airspace of mandatory carriage | j) DUE EIGHT POINT THREE THREE REQUIREMENT. |
| | * Denotes pilot transmission. |
| 12.3.1.6 CHANGE OF CALL SIGN | |
| ... to instruct an aircraft to change its type of call sign | a) CHANGE YOUR CALL SIGN TO (<i>new call sign</i>) [UNTIL FURTHER ADVISED]; |
| ... to advise an aircraft to revert to the call sign indicated in the flight plan | b) REVERT TO FLIGHT PLAN CALL SIGN (<i>call sign</i>) [AT (<i>significant point</i>)]. |
| 12.3.1.7 TRAFFIC INFORMATION | |
| ... to pass traffic information | a) TRAFFIC (<i>information</i>); |
| ... to acknowledge traffic information | b) NO REPORTED TRAFFIC; |
| | c) *LOOKING OUT; |
| | d) *TRAFFIC IN SIGHT; |
| | e) *NEGATIVE CONTACT [<i>reasons</i>]; |
| | f) [ADDITIONAL] TRAFFIC (<i>direction</i>) BOUND (<i>type of aircraft</i>) (<i>level</i>) ESTIMATED (<i>or OVER</i>) (<i>significant point</i>) AT (<i>time</i>); |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|---------------------------------------|---|
| 12.3.1.8 METEOROLOGICAL CONDITIONS | <p>g) TRAFFIC IS (<i>classification</i>) UNMANNED FREE BALLOON(S) WAS [<i>or ESTIMATED</i>] OVER (<i>place</i>) AT (<i>time</i>) REPORTED (<i>level(s)</i>) [<i>or LEVEL UNKNOWN</i>] MOVING (<i>direction</i>) (<i>other pertinent information, if any</i>).</p> <p>* Denotes pilot transmission.</p> |
| ... for multiple RVR observations | <p>a) [SURFACE] WIND (<i>number</i>) DEGREES (<i>speed</i>) (<i>units</i>);</p> <p>b) WIND AT (<i>level</i>) (<i>number</i>) DEGREES (<i>number</i>) KILOMETRES PER HOUR (or KNOTS);</p> <p><i>Note.— Wind is always expressed by giving the mean direction and speed and any significant variations thereof.</i></p> <p>c) VISIBILITY (<i>distance</i>) (<i>units</i>) [<i>direction</i>];</p> <p>d) RUNWAY VISUAL RANGE (or RVR) [RUNWAY (<i>number</i>)] (<i>distance</i>) (<i>units</i>);</p> <p>e) RUNWAY VISUAL RANGE (or RVR) RUNWAY (<i>number</i>) NOT AVAILABLE (or NOT REPORTED);</p> <p>f) RUNWAY VISUAL RANGE (or RVR) [RUNWAY (<i>number</i>)] (<i>first position</i>) (<i>distance</i>) (<i>units</i>), (<i>second position</i>) (<i>distance</i>) (<i>units</i>), (<i>third position</i>) (<i>distance</i>) (<i>units</i>);</p> <p><i>Note 1.— Multiple RVR observations are always representative of the touchdown zone, midpoint zone and the roll-out/stop end zone, respectively.</i></p> <p><i>Note 2.— Where reports for three locations are given, the indication of these locations may be omitted, provided that the reports are passed in the order of touchdown zone, followed by the midpoint zone and ending with the roll-out/stop end zone report.</i></p> |

| | |
|---|--|
| <p>... in the event that RVR information on any one position is not available this information will be included in the appropriate sequence</p> | <p>g) RUNWAY VISUAL RANGE (or RVR) [RUNWAY (number)] (first position) (distance) (units), (second position) NOT AVAILABLE, (third position) (distance) (units);</p> <p>h) PRESENT WEATHER (details);</p> <p>i) CLOUD (amount, [(type)] and height of base) (units) (or SKY CLEAR);</p> <p><i>Note.— Details of the means to describe the amount and type of cloud are in Chapter 11, 11.4.3.2.3.</i></p> <p>j) CAVOK;</p> <p><i>Note.— CAVOK pronounced CAV-O-KAY.</i></p> <p>k) TEMPERATURE [MINUS] (number) (and/or DEWPOINT [MINUS] (number));</p> <p>l) QNH (number) [units];</p> <p>m) QFE (number) [(units)];</p> <p>n) (aircraft type) REPORTED (description) ICING (or TURBULENCE) [IN CLOUD] (area) (time);</p> <p>o) REPORT FLIGHT CONDITIONS.</p> |
| <p>12.3.1.9 POSITION REPORTING</p> <p>... to omit position reports until a specified position</p> | <p>a) NEXT REPORT AT (significant point);</p> <p>b) OMIT POSITION REPORTS [UNTIL (specify)];</p> <p>c) RESUME POSITION REPORTING.</p> |
| <p>12.3.1.10 ADDITIONAL REPORTS</p> <p>... to request a report at a specified place or distance</p> <p>... to report at a specified place or distance</p> | <p>a) REPORT PASSING (significant point);</p> <p>b) REPORT (distance) MILES (GNSS or DME) FROM (name of DME station) (or significant point);</p> <p>c) *(distance) MILES (GNSS or DME) FROM (name of DME station) (or significant point);</p> |

*Circumstances**Phraseologies*

- d) REPORT PASSING (*three digits*) RADIAL (*name of VOR*) VOR;

| | |
|---|---|
| ... to request a report of present position | e) REPORT (GNSS <i>or</i> DME) DISTANCE FROM (<i>significant point</i>) <i>or</i> (<i>name of DME station</i>); |
| ... to report present position | f) *(<i>distance</i>) MILES (GNSS <i>or</i> DME) FROM (<i>name of DME station</i>) (<i>or significant point</i>). |
| | * Denotes pilot transmission. |
| <p>12.3.1.11 AERODROME INFORMATION</p> <p><i>Note 1.— See 11.4.3.4.3 for requirements for passing runway condition reports (RCRs) to pilots.</i></p> <p><i>Note 2.— This information is provided for runway thirds or the full runway, as applicable.</i></p> | <p>a) [(<i>location</i>)] RUNWAY (<i>number</i>) SURFACE CONDITION [CODE (<i>three digit number</i>)] followed as necessary by:</p> <ol style="list-style-type: none"> 1. ISSUED AT (<i>date and time UTC</i>); 2. DRY, <i>or</i> WET ICE, <i>or</i> WATER ON TOP OF COMPACTED SNOW, <i>or</i> DRY SNOW, <i>or</i> DRY SNOW ON TOP OF ICE, <i>or</i> WET SNOW ON TOP OF ICE, <i>or</i> ICE, <i>or</i> SLUSH, <i>or</i> STANDING WATER, <i>or</i> COMPACTED SNOW, <i>or</i> WET SNOW, <i>or</i> DRY SNOW ON TOP OF COMPACTED SNOW, <i>or</i> WET SNOW ON TOP OF COMPACTED SNOW, <i>or</i> WET, <i>or</i> FROST; 3. DEPTH ((<i>depth of deposit</i>) MILLIMETRES <i>or</i> NOT REPORTED); 4. COVERAGE ((<i>number</i>) PER CENT <i>or</i> NOT REPORTED); 5. ESTIMATED SURFACE FRICTION (GOOD, <i>or</i> GOOD TO MEDIUM, <i>or</i> MEDIUM, <i>or</i> MEDIUM TO POOR, <i>or</i> POOR, <i>or</i> LESS THAN POOR); 6. AVAILABLE WIDTH (<i>number</i>) METRES; 7. LENGTH REDUCED TO (<i>number</i>) METRES; 8. DRIFTING SNOW; 9. LOOSE SAND; 10. CHEMICALLY TREATED; |

11. SNOWBANK (*number*) METRES [LEFT, *or* RIGHT, *or* LEFT AND RIGHT] [OF *or* FROM] CENTRELINE;

| <i>Circumstances</i> | <i>Phraseologies</i> |
|---------------------------------|--|
| 12.3.3.4 EXPECTED APPROACH TIME | a) NO DELAY EXPECTED; b) EXPECTED APPROACH TIME (<i>time</i>); c) REVISED EXPECTED APPROACH TIME (<i>time</i>); d) DELAY NOT DETERMINED (<i>reasons</i>). |

12.3.4 Phraseologies for use on and in the vicinity of the aerodrome

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|--|
| 12.3.4.1 IDENTIFICATION OF AIRCRAFT | SHOW LANDING LIGHTS. |
| 12.3.4.2 ACKNOWLEDGEMENT BY VISUAL MEANS | a) ACKNOWLEDGE BY MOVING AILERONS (<i>or</i> RUDDER); b) ACKNOWLEDGE BY ROCKING WINGS; c) ACKNOWLEDGE BY FLASHING LANDING LIGHTS. |
| 12.3.4.3 STARTING PROCEDURES | |
| ... to request permission to start engines | a) *[<i>aircraft location</i>] REQUEST START UP; b) *[<i>aircraft location</i>] REQUEST START UP, INFORMATION (<i>ATIS identification</i>); |
| ... ATC replies | c) START UP APPROVED; d) START UP AT (<i>time</i>); |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|---|---|
| | e) EXPECT START UP AT (<i>time</i>); f) START UP AT OWN DISCRETION; g) EXPECT DEPARTURE (<i>time</i>) START UP AT OWN DISCRETION. * Denotes pilot transmission. |
| 12.3.4.4 PUSHBACK PROCEDURES <i>Note.— When local procedures so prescribe, authorization for pushback should be obtained from the control tower.</i> | |
| ... aircraft/ATC | a) *[<i>aircraft location</i>] REQUEST PUSHBACK; b) PUSHBACK APPROVED; c) STAND BY; d) PUSHBACK AT OWN DISCRETION; e) EXPECT (<i>number</i>) MINUTES DELAY DUE (<i>reason</i>). * Denotes pilot transmission. |
| 12.3.4.5 TOWING PROCEDURES | |
| ... ATC response | a) † REQUEST TOW [<i>company name</i>] (<i>aircraft type</i>) FROM (<i>location</i>) TO (<i>location</i>); b) TOW APPROVED VIA (<i>specific routing to be followed</i>); c) HOLD POSITION; d) STAND BY. † Denotes transmission from aircraft/tow vehicle combination. |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|---|
| 12.3.4.6 TO REQUEST TIME CHECK AND/OR AERODROME DATA FOR DEPARTURE ... when no ATIS broadcast is available | <p>a) * REQUEST TIME CHECK;</p> <p>b) TIME (<i>time</i>);</p> <p>c) * REQUEST DEPARTURE INFORMATION;</p> <p>d) RUNWAY (<i>number</i>), WIND (<i>direction and speed</i>) (<i>units</i>) QNH (or QFE) (<i>number</i>) [(<i>units</i>)] TEMPERATURE [MINUS] (<i>number</i>), [VISIBILITY (<i>distance</i>) (<i>units</i>) (or RUNWAY VISUAL RANGE (or RVR) (<i>distance</i>) (<i>units</i>))] [TIME (<i>time</i>)].</p> <p><i>Note.— If multiple visibility and RVR observations are available, those that represent the roll-out/stop end zone should be used for take-off.</i></p> <p>* Denotes pilot transmission.</p> |
| 12.3.4.7 TAXI PROCEDURES ... for departure | <p>a) *[<i>aircraft type</i>] [<i>wake turbulence category if “super” or “heavy”</i>] [<i>aircraft location</i>] REQUEST TAXI [<i>intentions</i>];</p> <p>b) *[<i>aircraft type</i>] [<i>wake turbulence category if “super” or “heavy”</i>] [<i>aircraft location</i>] (<i>flight rules</i>) TO (<i>aerodrome of destination</i>) REQUEST TAXI [<i>intentions</i>];</p> <p>c) TAXI TO HOLDING POINT [<i>number</i>] [RUNWAY (<i>number</i>)] [HOLD SHORT OF RUNWAY (<i>number</i>) (or CROSS RUNWAY (<i>number</i>))] [TIME (<i>time</i>)];</p> |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|---|
| ... where detailed taxi instructions are required | <p>d) *[<i>aircraft type</i>] [<i>wake turbulence category if “super” or “heavy”</i>] REQUEST DETAILED TAXI INSTRUCTIONS;</p> <p>e) TAXI TO HOLDING POINT [<i>number</i>] [<i>RUNWAY (number)</i>] VIA (<i>specific route to be followed</i>) [<i>TIME (time)</i>] [<i>HOLD SHORT OF RUNWAY (number) (or CROSS RUNWAY (number))</i>];</p> |
| ... where aerodrome information is not available from an alternative source such as ATIS | <p>f) TAXI TO HOLDING POINT [<i>number</i>] (<i>followed by aerodrome information as applicable</i>) [<i>TIME (time)</i>];</p> <p>g) TAKE (<i>or TURN</i>) FIRST (<i>or SECOND</i>) LEFT (<i>or RIGHT</i>);</p> <p>h) TAXI VIA (<i>identification of taxiway</i>);</p> <p>i) TAXI VIA RUNWAY (<i>number</i>);</p> <p>j) TAXI TO TERMINAL (<i>or other location, e.g. GENERAL AVIATION AREA</i>) [<i>STAND (number)</i>];</p> |
| ... for helicopter operations | <p>k) *REQUEST AIR-TAXIING FROM (<i>or VIA</i>) TO (<i>location or routing as appropriate</i>);</p> <p>l) AIR-TAXI TO (<i>or VIA</i>) (<i>location or routing as appropriate</i>) [<i>CAUTION (dust, blowing snow, loose debris, taxiing light aircraft, personnel, etc.)</i>];</p> <p>m) AIR TAXI VIA (<i>direct, as requested, or specified route</i>) TO (<i>location, heliport, operating or movement area, active or inactive runway</i>). AVOID (<i>aircraft or vehicles or personnel</i>);</p> |
| ... after landing | <p>n) *REQUEST BACKTRACK;</p> <p>o) BACKTRACK APPROVED;</p> |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|----------------------|--|
| ... general | <p>p) BACKTRACK RUNWAY (<i>number</i>);</p> <p>q) *[(<i>aircraft location</i>)] REQUEST TAXI TO (<i>destination on aerodrome</i>);</p> <p>r) TAXI STRAIGHT AHEAD;</p> <p>s) TAXI WITH CAUTION;</p> <p>t) GIVE WAY TO (<i>description and position of other aircraft</i>);</p> <p>u) *GIVING WAY TO (<i>traffic</i>);</p> <p>v) *TRAFFIC (<i>or type of aircraft</i>) IN SIGHT;</p> <p>w) TAXI INTO HOLDING BAY;</p> <p>x) FOLLOW (<i>description of other aircraft or vehicle</i>);</p> <p>y) VACATE RUNWAY;</p> <p>z) *RUNWAY VACATED;</p> <p>aa) EXPEDITE TAXI [(<i>reason</i>)];</p> <p>bb) *EXPEDITING;</p> <p>cc) [CAUTION] TAXI SLOWER [<i>reason</i>];</p> <p>dd) *SLOWING DOWN.</p> <p>* Denotes pilot transmission.</p> |
| 12.3.4.8 HOLDING | <p>a) ‡HOLD (<i>direction</i>) OF (<i>position, runway number, etc.</i>);</p> <p>b) ‡HOLD POSITION;</p> <p>c) ‡HOLD (<i>distance</i>) FROM (<i>position</i>);</p> |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|---|---|
| <p>... to hold not closer to a runway than specified in Chapter 7, 7.6.3.1.3.1</p> | <p>d) ‡HOLD SHORT OF (<i>position</i>);</p> <p>e) * HOLDING;</p> <p>f) *HOLDING SHORT.</p> <p>‡ Requires specific acknowledgement from the pilot.</p> <p>* Denotes pilot transmission. The procedure words ROGER and WILCO are insufficient acknowledgement of the instructions HOLD, HOLD POSITION and HOLD SHORT OF (<i>position</i>). In each case the acknowledgement shall be by the phraseology HOLDING or HOLDING SHORT, as appropriate.</p> |
| 12.3.4.9 TO CROSS A RUNWAY | <p>a) *REQUEST CROSS RUNWAY (<i>number</i>);</p> <p><i>Note.— If the control tower is unable to see the crossing aircraft (e.g. night, low visibility), the instruction should always be accompanied by a request to report when the aircraft has vacated the runway.</i></p> |
| | b) CROSS RUNWAY (<i>number</i>) [REPORT VACATED]; |
| | c) EXPEDITE CROSSING RUNWAY (<i>number</i>) TRAFFIC (<i>aircraft type</i>) (<i>distance</i>) KILOMETRES (or MILES) FINAL; |
| | d) TAXI TO HOLDING POINT [<i>number</i>] [RUNWAY (<i>number</i>)] VIA (<i>specific route to be followed</i>), [HOLD SHORT OF RUNWAY (<i>number</i>)] or [CROSS RUNWAY (<i>number</i>)]; |
| <p><i>Note.— The pilot will, when requested, report “RUNWAY VACATED” when the entire aircraft is beyond the relevant runway-holding position.</i></p> | <p>e) *RUNWAY VACATED.</p> <p>* Denotes pilot transmission.</p> |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|--|
| 12.3.4.10 PREPARATION FOR TAKE-OFF | <p>a) UNABLE TO ISSUE (<i>designator</i>) DEPARTURE (<i>reasons</i>);</p> <p>b) REPORT WHEN READY [FOR DEPARTURE];</p> <p>c) ARE YOU READY [FOR DEPARTURE]?;</p> <p>d) ARE YOU READY FOR IMMEDIATE DEPARTURE?;</p> <p>e) *READY;</p> |
| ... clearance to enter runway and await take-off clearance | <p>f) LINE UP [AND WAIT];</p> <p>g) †LINE UP RUNWAY (<i>number</i>);</p> <p>h) LINE UP. BE READY FOR IMMEDIATE DEPARTURE;</p> |
| ... conditional clearances | <p>i) (<i>condition</i>) LINE UP (<i>brief reiteration of the condition</i>);</p> |
| ... acknowledgement of a conditional clearance | <p>j) (<i>condition</i>) LINING UP (<i>brief reiteration of the condition</i>);</p> |
| ... confirmation or otherwise of the readback of conditional clearance | <p>k) [THAT IS] CORRECT (<i>or</i> NEGATIVE) [I SAY AGAIN] ... (<i>as appropriate</i>).</p> |
| | <p>* Denotes pilot transmission.</p> <p>† When there is the possibility of confusion during multiple runway operations.</p> |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|--|
| | ‡ Provisions concerning the use of conditional clearances are contained in 12.2.7. |
| 12.3.4.11 TAKE-OFF CLEARANCE | |
| | a) RUNWAY (<i>number</i>) CLEARED FOR TAKE-OFF [REPORT AIRBORNE]; |
| ... when reduced runway separation is used | b) (<i>traffic information</i>) RUNWAY (<i>number</i>) CLEARED FOR TAKE-OFF; |
| ... when take-off clearance has not been complied with | c) TAKE OFF IMMEDIATELY OR VACATE RUNWAY[(<i>instructions</i>)]; d) TAKE OFF IMMEDIATELY OR HOLD SHORT OF RUNWAY; |
| ... to cancel a take-off clearance | e) HOLD POSITION, CANCEL TAKE-OFF I SAY AGAIN CANCEL TAKE-OFF (<i>reasons</i>); f) *HOLDING; |
| ... to stop a take-off after an aircraft has commenced take-off roll | g) STOP IMMEDIATELY [(<i>repeat aircraft call sign</i>) STOP IMMEDIATELY]; h) *STOPPING; |
| ... for helicopter operations | i) CLEARED FOR TAKE-OFF [FROM (<i>location</i>)] (<i>present position, taxiway, final approach and take-off area, runway and number</i>); j) *REQUEST DEPARTURE INSTRUCTIONS; k) AFTER DEPARTURE TURN RIGHT (<i>or</i> LEFT, <i>or</i> CLIMB) (<i>instructions as appropriate</i>). * Denotes pilot transmission. HOLDING and STOPPING are the procedural responses to e) and g) respectively. |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|---|---|
| 12.3.4.12 TURN OR CLIMB INSTRUCTIONS AFTER TAKE-OFF | a) *REQUEST RIGHT (<i>or</i> LEFT) TURN; b) RIGHT (<i>or</i> LEFT) TURN APPROVED; c) WILL ADVISE LATER FOR RIGHT (<i>or</i> LEFT) TURN; d) REPORT AIRBORNE; e) AIRBORNE (<i>time</i>); f) AFTER PASSING (<i>level</i>) (<i>instructions</i>); g) CONTINUE RUNWAY HEADING (<i>instructions</i>); h) TRACK EXTENDED CENTRE LINE (<i>instructions</i>); i) CLIMB STRAIGHT AHEAD (<i>instructions</i>). * Denotes pilot transmission. |
| ... to request airborne time | |
| ... heading to be followed | |
| ... when a specific track is to be followed | |
| 12.3.4.13 ENTERING AN AERODROME TRAFFIC CIRCUIT | a) *[<i>aircraft type</i>] (<i>position</i>) (<i>level</i>) FOR LANDING; b) JOIN [(<i>direction of circuit</i>)] (<i>position in circuit</i>) (<i>runway number</i>) [SURFACE] WIND (<i>direction and speed</i>) (<i>units</i>) [TEMPERATURE [MINUS] (<i>number</i>)] QNH (<i>or</i> QFE) (<i>number</i>) [(<i>units</i>)] [TRAFFIC (<i>detail</i>)]; |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|---|--|
| ... when ATIS information is available | <p>c) MAKE STRAIGHT-IN APPROACH, RUNWAY (<i>number</i>) [SURFACE] WIND (<i>direction and speed</i>) (<i>units</i>) [TEMPERATURE [MINUS] (<i>number</i>)] QNH (<i>or</i> QFE) (<i>number</i>) [(<i>units</i>)] [TRAFFIC (<i>detail</i>)];</p> <p>d) *(<i>aircraft type</i>) (<i>position</i>) (<i>level</i>) INFORMATION (ATIS identification) FOR LANDING;</p> <p>e) JOIN (<i>position in circuit</i>) [RUNWAY (<i>number</i>)] QNH (<i>or</i> QFE) (<i>number</i>) [(<i>units</i>)] [TRAFFIC (<i>detail</i>)].</p> <p>* Denotes pilot transmission.</p> |
| 12.3.4.14 IN THE CIRCUIT | <p>a) *(<i>position in circuit</i>, e.g. DOWNWIND/FINAL);</p> <p>b) NUMBER ... FOLLOW (<i>aircraft type and position</i>) [<i>additional instructions if required</i>].</p> <p>* Denotes pilot transmission.</p> |
| 12.3.4.15 APPROACH INSTRUCTIONS | <p>a) MAKE SHORT APPROACH;</p> <p>b) MAKE LONG APPROACH (<i>or</i> EXTEND DOWNWIND);</p> <p>c) REPORT BASE (<i>or</i> FINAL, <i>or</i> LONG FINAL);</p> <p>d) CONTINUE APPROACH [PREPARE FOR POSSIBLE GO AROUND].</p> |
| <p><i>Note.— The report “LONG FINAL” is made when aircraft turn on to final approach at a distance greater than 7 km (4 NM) from touchdown or when an aircraft on a straight-in approach is 15 km (8 NM) from touchdown. In both cases a report “FINAL” is required at 7 km (4 NM) from touchdown.</i></p> <p>12.3.4.16 LANDING CLEARANCE</p> | <p>a) RUNWAY (<i>number</i>) CLEARED TO LAND;</p> |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|---|
| ... when reduced runway separation is used | b) (traffic information) RUNWAY (number) CLEARED TO LAND; |
| ... special operations | c) CLEARED TOUCH AND GO; |
| | d) MAKE FULL STOP; |
| ... to make an approach along, or parallel to a runway, descending to an agreed minimum level | e) *REQUEST LOW APPROACH (reasons); |
| | f) CLEARED LOW APPROACH [RUNWAY (number)] [(altitude restriction if required) (go around instructions)]; |
| ... to fly past the control tower or other observation point for the purpose of visual inspection by persons on the ground | g) *) REQUEST LOW PASS (reasons); |
| | h) CLEARED LOW PASS [<i>as in f</i>]); |
| ... for helicopter operations | i) *REQUEST STRAIGHT-IN (<i>or</i> CIRCLING APPROACH, LEFT (<i>or</i> RIGHT) TURN TO (location)); |
| | j) MAKE STRAIGHT-IN (<i>or</i> CIRCLING APPROACH, LEFT (<i>or</i> RIGHT) TURN TO (location, runway, taxiway, final approach and take-off area)) [ARRIVAL (<i>or</i> ARRIVAL ROUTE) (number, name, or code)]. [HOLD SHORT OF (active runway, extended runway centre line, other)]. [REMAIN (direction or distance) FROM (runway, runway centre line, other helicopter or aircraft)]. [CAUTION (power lines, unlighted obstructions, wake turbulence, etc.)]. CLEARED TO LAND. |
| | * Denotes pilot transmission. |
| 12.3.4.17 DELAYING AIRCRAFT | a) CIRCLE THE AERODROME; |
| | b) ORBIT (RIGHT, <i>or</i> LEFT) [FROM PRESENT POSITION]; |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|--|
| 12.3.4.18 MISSED APPROACH | c) MAKE ANOTHER CIRCUIT. |
| | a) GO AROUND; |
| | b) *GOING AROUND. * Denotes pilot transmission. |
| 12.3.4.19 INFORMATION TO AIRCRAFT | |
| ... when pilot requested visual inspection of landing gear | a) LANDING GEAR APPEARS DOWN; |
| | b) RIGHT (<i>or</i> LEFT, <i>or</i> NOSE) WHEEL APPEARS UP (<i>or</i> DOWN); |
| | c) WHEELS APPEAR UP; |
| | d) RIGHT (<i>or</i> LEFT, <i>or</i> NOSE) WHEEL DOES NOT APPEAR UP (<i>or</i> DOWN); |
| ... wake turbulence | e) CAUTION WAKE TURBULENCE [FROM ARRIVING (<i>or</i> DEPARTING) (<i>type of aircraft</i>)] [<i>additional information as required</i>]; |
| ... jet blast on apron or taxiway | f) CAUTION JET BLAST; |
| ... propeller-driven aircraft slipstream | g) CAUTION SLIPSTREAM. |
| 12.3.4.20 RUNWAY VACATING AND COMMUNICATIONS AFTER LANDING | a) CONTACT GROUND (<i>frequency</i>); |
| | b) WHEN VACATED CONTACT GROUND (<i>frequency</i>); |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|-------------------------------|---|
| | c) EXPEDITE VACATING; |
| | d) YOUR STAND (or GATE) (designation); |
| | e) TAKE (or TURN) FIRST (or SECOND, or CONVENIENT) LEFT (or RIGHT) AND CONTACT GROUND (frequency); |
| ... for helicopter operations | f) AIR-TAXI TO HELICOPTER STAND (or) HELICOPTER PARKING POSITION (area); |
| | g) AIR-TAXI TO (or VIA) (location or routing as appropriate) [CAUTION (dust, blowing snow, loose debris, taxiing light aircraft, personnel, etc.)]; |
| | h) AIR-TAXI VIA (direct, as requested, or specified route) TO (location, heliport, operating or movement area, active or inactive runway). AVOID (aircraft or vehicles or personnel). |

12.3.5 Coordination between ATS units

| <i>Circumstances</i> | <i>Phraseologies</i> |
|---|--|
| 12.3.5.1 ESTIMATES AND REVISIONS | a) ESTIMATE [direction of flight] (aircraft call sign) [SQUAWKING (SSR code)] (type) ESTIMATED (significant point) (time) (level) (or DESCENDING FROM (level) TO (level)) [SPEED (filed TAS)] (route) [REMARKS]; |
| ... sending unit | b) ESTIMATE (significant point) ON (aircraft call sign); |
| ... receiving unit reply (if flight plan details are not available) | c) NO DETAILS; |
| ... receiving unit reply (if flight plan details are available) | (aircraft type) (destination); |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|------------------------------|---|
| ... sending unit reply | <p>[SQUAWKING (<i>SSR code</i>)] [ESTIMATED] (<i>significant point</i>) (<i>time</i>) AT (<i>level</i>);</p> <p>Note.— In the event that flight plan details are not available the receiving station shall reply to b) NO DETAILS and transmitting station shall pass full estimate as in a).</p> <p>d) ESTIMATE UNMANNED FREE BALLOON(S) (<i>identification and classification</i>) ESTIMATED OVER (<i>place</i>) AT (<i>time</i>) REPORTED FLIGHT LEVEL(S) (<i>figure or figures</i>) [<i>or</i> FLIGHT LEVEL UNKNOWN] MOVING (<i>direction</i>) ESTIMATED GROUND SPEED (<i>figure</i>) (<i>other pertinent information, if any</i>);</p> <p>e) REVISION (<i>aircraft call sign</i>) (<i>details as necessary</i>).</p> |
| 12.3.5.2 TRANSFER OF CONTROL | <p>a) REQUEST RELEASE OF (<i>aircraft call sign</i>);</p> <p>b) (<i>aircraft call sign</i>) RELEASED [AT (<i>time</i>)] [<i>conditions/restrictions</i>];</p> <p>c) IS (<i>aircraft call sign</i>) RELEASED [FOR CLIMB (<i>or</i> DESCENT)];</p> <p>d) (<i>aircraft call sign</i>) NOT RELEASED [UNTIL (<i>time or significant point</i>)];</p> <p>e) UNABLE (<i>aircraft call sign</i>) [TRAFFIC IS (<i>details</i>)].</p> |
| 12.3.5.3 CHANGE OF CLEARANCE | <p>a) MAY WE <i>CHANGE CLEARANCE OF</i> (<i>aircraft call sign</i>) TO (<i>details of alteration proposed</i>);</p> <p>b) AGREED TO (<i>alteration of clearance</i>) OF (<i>aircraft call sign</i>);</p> <p>c) UNABLE (<i>aircraft call sign</i>);</p> |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|--|
| 12.3.5.4 APPROVAL REQUEST | d) UNABLE (<i>desired route, level, etc.</i>) [FOR (<i>aircraft call sign</i>)] [DUE (<i>reason</i>)] (<i>alternative clearance proposed</i>). |
| | a) APPROVAL REQUEST (<i>aircraft call sign</i>) ESTIMATED DEPARTURE FROM (<i>significant point</i>) AT (<i>time</i>); |
| | b) (<i>aircraft call sign</i>) REQUEST APPROVED [(<i>restriction if any</i>)]; |
| 12.3.5.5 INBOUND RELEASE | c) (<i>aircraft call sign</i>) UNABLE (<i>alternative instructions</i>). |
| | [INBOUND RELEASE] (<i>aircraft call sign</i>) [SQUAWKING (<i>SSR code</i>)] (<i>type</i>) FROM (<i>departure point</i>) RELEASED AT (<i>significant point, or time, or level</i>) CLEARED TO AND ESTIMATING (<i>clearance limit</i>) (<i>time</i>) AT (<i>level</i>) [EXPECTED APPROACH TIME or NO DELAY EXPECTED] CONTACT AT (<i>time</i>). |
| 12.3.5.6 HANDOVER | HANDOVER (<i>aircraft call sign</i>) [SQUAWKING (<i>SSR code</i>)] POSITION (<i>aircraft position</i>) (<i>level</i>). |
| 12.3.5.7 EXPEDITION OF CLEARANCE | a) EXPEDITE CLEARANCE (<i>aircraft call sign</i>) EXPECTED DEPARTURE FROM (<i>place</i>) AT (<i>time</i>); |
| | b) EXPEDITE CLEARANCE (<i>aircraft call sign</i>) [ESTIMATED] OVER (<i>place</i>) AT (<i>time</i>) REQUESTS (<i>level or route, etc.</i>). |
| 12.3.5.8 REDUCED VERTICAL SEPARATION MINIMUM (RVSM) OPERATIONS | |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|--|
| ... to verbally supplement estimate messages of aircraft non-approved for RVSM or to verbally supplement an automated estimate message exchange that does not automatically transfer information from Item 18 of the flight plan followed by supplementary information, as appropriate | a) NEGATIVE RVSM [(supplementary information, e.g. State aircraft)]; |
| ... to communicate the cause of a contingency relating to an aircraft that is unable to conduct RVSM operations due to severe turbulence or other severe meteorological phenomena or equipment failure, as applicable | b) UNABLE RVSM DUE TURBULENCE (or EQUIPMENT, as applicable). |

12.3.6 Phraseologies to be used related to CPDLC

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|--|
| 12.3.6.1 OPERATIONAL STATUS | |
| ... failure of CPDLC | a) [ALL STATIONS] CPDLC FAILURE (<i>instructions</i>); |
| ... failure of a single CPDLC message | b) CPDLC MESSAGE FAILURE (<i>appropriate clearance, instruction, information or request</i>); |
| ... to correct CPDLC clearances, instructions, information or requests | c) DISREGARD CPDLC (<i>message type</i>) MESSAGE, BREAK (<i>correct clearance, instruction, information or request</i>); |
| ... to instruct all stations or a specific flight to avoid sending CPDLC requests for a limited period of time | d) [ALL STATIONS] STOP SENDING CPDLC REQUESTS [UNTIL ADVISED] [(<i>reason</i>)]; |
| ... to resume normal use of CPDLC | e) [ALL STATIONS] RESUME NORMAL CPDLC OPERATIONS. |

12.4 ATS SURVEILLANCE SERVICE PHRASEOLOGIES

Note.— The following comprise phraseologies specifically applicable when an ATS surveillance system is used in the provision of air traffic services. The phraseologies detailed in the sections above for use in the provision of air traffic services are also applicable, as appropriate, when an ATS surveillance system is used.

12.4.1 General ATS surveillance service phraseologies

| <i>Circumstances</i> | <i>Phraseologies</i> |
|-------------------------------------|---|
| 12.4.1.1 IDENTIFICATION OF AIRCRAFT | <ul style="list-style-type: none"> a) REPORT HEADING [AND FLIGHT LEVEL (<i>or</i> ALTITUDE)]; b) FOR IDENTIFICATION TURN LEFT (<i>or</i> RIGHT) HEADING (<i>three digits</i>); c) TRANSMIT FOR IDENTIFICATION AND REPORT HEADING; d) RADAR CONTACT [<i>position</i>]; e) IDENTIFIED [<i>position</i>]; f) NOT IDENTIFIED [<i>reason</i>], [RESUME (<i>or</i> CONTINUE) OWN NAVIGATION]. |
| 12.4.1.2 POSITION INFORMATION | POSITION (<i>distance</i>) (<i>direction</i>) OF (<i>significant point</i>) (<i>or</i> OVER <i>or</i> ABEAM (<i>significant point</i>)). |
| 12.4.1.3 VECTORING INSTRUCTIONS | <ul style="list-style-type: none"> a) LEAVE (<i>significant point</i>) HEADING (<i>three digits</i>); b) CONTINUE HEADING (<i>three digits</i>); c) CONTINUE PRESENT HEADING; c) FLY HEADING (<i>three digits</i>); |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|--|
| 12.4.1.4 TERMINATION OF VECTORING | d) TURN LEFT (or RIGHT) HEADING (<i>three digits</i>) [<i>reason</i>]; e) f) TURN LEFT (or RIGHT) (<i>number of degrees</i>) DEGREES [<i>reason</i>]; f) STOP TURN HEADING (<i>three digits</i>); g) FLY HEADING (<i>three digits</i>), WHEN ABLE PROCEED DIRECT (<i>name</i>) (<i>significant point</i>); h) HEADING IS GOOD. |
| | a) RESUME OWN NAVIGATION (<i>position of aircraft</i>) (<i>specific instructions</i>); b) RESUME OWN NAVIGATION [DIRECT] (<i>significant point</i>) [MAGNETIC TRACK (<i>three digits</i>) DISTANCE (<i>number</i>) KILOMETRES (or MILES)]. |
| 12.4.1.5 MANOEUVRES | a) a) MAKE A THREE SIXTY TURN LEFT (or RIGHT) [<i>reason</i>]; b) ORBIT LEFT (or RIGHT) [<i>reason</i>]; c) MAKE ALL TURNS RATE ONE (or RATE HALF, or (<i>number</i>) DEGREES PER SECOND) START AND STOP ALL TURNS ON THE COMMAND “NOW”; d) TURN LEFT (or RIGHT) NOW; e) STOP TURN NOW. |
| <p>... (in case of unreliable directional instruments on board aircraft)</p> <p><i>Note.— When it is necessary to specify a reason for vectoring or for the above manoeuvres, the following phraseologies should be used:</i></p> <p>a) DUE TRAFFIC; b) FOR SPACING; c) FOR DELAY; d) FOR DOWNLOAD (or BASE, or FINAL);</p> | |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|------------------------------|--|
| 12.4.1.6 SPEED CONTROL | <p>a) REPORT SPEED;</p> <p>b) * SPEED (<i>number</i>) KILOMETRES PER HOUR (<i>or</i> KNOTS);</p> <p>c) MAINTAIN (<i>number</i>) KILOMETRES PER HOUR (<i>or</i> KNOTS) [OR GREATER (<i>or</i> OR LESS)] [UNTIL (<i>significant point</i>)];</p> <p>d) DO NOT EXCEED (<i>number</i>) KILOMETRES PER HOUR (<i>or</i> KNOTS);</p> <p>e) MAINTAIN PRESENT SPEED;</p> <p>f) INCREASE (<i>or</i> REDUCE) SPEED TO (<i>number</i>) KILOMETRES PER HOUR (<i>or</i> KNOTS) [OR GREATER (<i>or</i> OR LESS)];</p> <p>g) INCREASE (<i>or</i> REDUCE) SPEED BY (<i>number</i>) KILOMETRES PER HOUR (<i>or</i> KNOTS);</p> <p>h) RESUME NORMAL SPEED;</p> <p>i) REDUCE TO MINIMUM APPROACH SPEED;</p> <p>j) REDUCE TO MINIMUM CLEAN SPEED;</p> <p>k) RESUME PUBLISHED SPEED;</p> <p>l) NO [ATC] SPEED RESTRICTIONS.</p> <p>* Denotes pilot transmission.</p> |
| 12.4.1.7 POSITION REPORTING | |
| ... to omit position reports | a) OMIT POSITION REPORTS [UNTIL (<i>specify</i>)]; |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|---|
| | b) NEXT REPORT AT (<i>significant point</i>); c) REPORTS REQUIRED ONLY AT (<i>significant point(s)</i>); d) RESUME POSITION REPORTING. |
| 12.4.1.8 TRAFFIC INFORMATION AND AVOIDING ACTION | a) TRAFFIC (<i>number</i>) O'CLOCK (<i>distance</i>) (<i>direction of flight</i>) [<i>any other pertinent information</i>]: 1. UNKNOWN; 2. SLOW MOVING; 3. FAST MOVING; 4. CLOSING; 5. OPPOSITE (or SAME) DIRECTION; 6. OVERTAKING; 7. CROSSING LEFT TO RIGHT (or RIGHT TO LEFT); ... (if known) 8. (<i>aircraft type</i>); 9. (<i>level</i>); 10. CLIMBING (<i>or</i> DESCENDING); ... to request avoiding action b) *REQUEST VECTORS; c) DO YOU WANT VECTORS?; |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|---|---|
| ... when passing unknown traffic | d) CLEAR OF TRAFFIC [<i>appropriate instructions</i>]; |
| ... for avoiding action | e) TURN LEFT (<i>or RIGHT</i>) IMMEDIATELY HEADING (<i>three digits</i>) TO AVOID [UNIDENTIFIED] TRAFFIC (<i>bearing by clock-reference and distance</i>); f) TURN LEFT (<i>or RIGHT</i>) (<i>number of degrees</i>) DEGREES IMMEDIATELY TO AVOID [UNIDENTIFIED] TRAFFIC AT (<i>bearing by clock-reference and distance</i>). * Denotes pilot transmission. |
| 12.4.1.9 COMMUNICATIONS AND LOSS OF COMMUNICATIONS | a) [IF] RADIO CONTACT LOST (<i>instructions</i>); b) IF NO TRANSMISSIONS RECEIVED FOR (<i>number</i>) MINUTES (<i>or SECONDS</i>) (<i>instructions</i>); c) REPLY NOT RECEIVED (<i>instructions</i>); |
| ... if loss of communications suspected | d) IF YOU READ [<i>manoeuvre instructions or SQUAWK (code or IDENT)</i>]; e) (<i>manoeuvre, SQUAWK or IDENT</i>) OBSERVED. POSITION (<i>position of aircraft</i>). [<i>(instructions)</i>]. |
| 12.4.1.10 TERMINATION OF RADAR AND/OR ADS-B SERVICE | a) RADAR SERVICE (<i>or IDENTIFICATION</i>) TERMINATED [DUE (<i>reason</i>)] (<i>instructions</i>); b) WILL SHORTLY LOSE IDENTIFICATION (<i>appropriate instructions or information</i>); c) IDENTIFICATION LOST [<i>reasons</i>] (<i>instructions</i>). |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|---|
| 12.4.1.11 RADAR AND/OR ADS-B EQUIPMENT DEGRADATION | <p>a) SECONDARY RADAR OUT OF SERVICE (<i>appropriate information as necessary</i>);</p> <p>b) PRIMARY RADAR OUT OF SERVICE (<i>appropriate information as necessary</i>);</p> <p>c) ADS-B OUT OF SERVICE (<i>appropriate information as necessary</i>).</p> |

12.4.2 Radar in approach control service

| <i>Circumstances</i> | <i>Phraseologies</i> |
|---|--|
| 12.4.2.1 VECTORING FOR APPROACH | <p>a) VECTORING FOR (<i>type of pilot-interpreted aid</i>) APPROACH RUNWAY (<i>number</i>);</p> <p>b) VECTORING FOR VISUAL APPROACH RUNWAY (<i>number</i>) REPORT FIELD (<i>or</i> RUNWAY) IN SIGHT;</p> <p>c) VECTORING FOR (<i>positioning in the circuit</i>);</p> <p>d) VECTORING FOR SURVEILLANCE RADAR APPROACH RUNWAY (<i>number</i>);</p> <p>e) VECTORING FOR PRECISION APPROACH RUNWAY (<i>number</i>);</p> <p>f) (<i>type</i>) APPROACH NOT AVAILABLE DUE (<i>reason</i>) (<i>alternative instructions</i>).</p> |
| 12.4.2.2 VECTORING FOR ILS AND OTHER PILOT-INTERPRETED AIDS | <p>a) POSITION (<i>number</i>) KILOMETRES (<i>or</i> MILES) from (<i>fix</i>). TURN LEFT (<i>or</i> RIGHT) HEADING (<i>three digits</i>);</p> |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|--|--|
| <p>... when a pilot wishes to be positioned a specific distance from touchdown</p> <p>... instructions and information</p> | <p>b) YOU WILL INTERCEPT (<i>radio aid or track</i>) (<i>distance</i>) FROM (<i>significant point or TOUCHDOWN</i>);</p> <p>c) *REQUEST (<i>distance</i>) FINAL;</p> <p>d) CLEARED FOR (<i>type of approach</i>) APPROACH RUNWAY (<i>number</i>);</p> <p>e) REPORT ESTABLISHED ON [ILS] LOCALIZER (<i>or ON GBAS/SBAS/MLS APPROACH COURSE</i>);</p> <p>f) CLOSING FROM LEFT (<i>or RIGHT</i>) [REPORT ESTABLISHED];</p> <p>g) TURN LEFT (<i>or RIGHT</i>) HEADING (<i>three digits</i>) [TO INTERCEPT] <i>or</i> [REPORT ESTABLISHED];</p> <p>h) EXPECT VECTOR ACROSS (<i>localizer course or radio aid</i>) (<i>reason</i>);</p> <p>i) THIS TURN WILL TAKE YOU THROUGH (<i>localizer course or radio aid</i>) [<i>reason</i>];</p> <p>j) TAKING YOU THROUGH (<i>localizer course or radio aid</i>) [<i>reason</i>];</p> <p>k) MAINTAIN (<i>altitude</i>) UNTIL GLIDE PATH INTERCEPTION;</p> <p>l) REPORT ESTABLISHED ON GLIDE PATH;</p> <p>m) INTERCEPT (<i>localizer course or radio aid</i>) [REPORT ESTABLISHED].</p> <p>* Denotes pilot transmission.</p> |
| 12.4.2.3 MANOEUVRE DURING INDEPENDENT AND DEPENDENT PARALLEL APPROACHES | <p>a) CLEARED FOR (<i>type of approach</i>) APPROACH RUNWAY (<i>number</i>) LEFT (<i>or RIGHT</i>);</p> |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|---|--|
| <p>... for avoidance action when an aircraft is observed penetrating the NTZ</p> <p>... for avoidance action below 120 m (400 ft) above the runway threshold elevation where parallel approach obstacle assessment surfaces (PAOAS) criteria are being applied</p> <p>12.4.2.4 SURVEILLANCE RADAR APPROACH</p> <p>PROVISION OF SERVICE</p> <p>ELEVATION</p> | <p>b) YOU HAVE CROSSED THE LOCALIZER (or GBAS/SBAS/MLS FINAL APPROACH COURSE). TURN LEFT (or RIGHT) IMMEDIATELY AND RETURN TO THE LOCALIZER (or GBAS/SBAS/MLS FINAL APPROACH COURSE);</p> <p>c) ILS (or MLS) RUNWAY (<i>number</i>) LEFT (or RIGHT) LOCALIZER (or MLS) FREQUENCY IS (<i>frequency</i>);</p> <p>d) TURN LEFT (or RIGHT) (<i>number</i>) DEGREES (or HEADING) (<i>three digits</i>) IMMEDIATELY TO AVOID TRAFFIC [DEVIATING FROM ADJACENT APPROACH], CLIMB TO (<i>altitude</i>);</p> <p>e) CLIMB TO (<i>altitude</i>) IMMEDIATELY TO AVOID TRAFFIC [DEVIATING FROM ADJACENT APPROACH] (<i>further instructions</i>).</p> <p>a) THIS WILL BE A SURVEILLANCE RADAR APPROACH RUNWAY (<i>number</i>) TERMINATING AT (<i>distance</i>) FROM TOUCHDOWN, OBSTACLE CLEARANCE ALTITUDE (or HEIGHT) (<i>number</i>) METRES (or FEET) CHECK YOUR MINIMA [IN CASE OF GO AROUND (<i>instructions</i>)];</p> <p>b) APPROACH INSTRUCTIONS WILL BE TERMINATED AT (<i>distance</i>) FROM TOUCHDOWN.</p> <p>a) COMMENCE DESCENT NOW [TO MAINTAIN A (<i>number</i>) DEGREE GLIDE PATH];</p> <p>b) (<i>distance</i>) FROM TOUCHDOWN ALTITUDE (or HEIGHT) SHOULD BE (<i>numbers and units</i>).</p> |

| <i>Circumstances</i> | <i>Phraseologies</i> |
|------------------------|--|
| POSITION | (<i>distance</i>) FROM TOUCHDOWN. |
| CHECKS | a) CHECK GEAR DOWN [AND LOCKED]; b) OVER THRESHOLD. |
| COMPLETION OF APPROACH | a) REPORT VISUAL; b) REPORT RUNWAY [LIGHTS] IN SIGHT; c) APPROACH COMPLETED [CONTACT (<i>unit</i>)]. |
| 12.4.2.5 PAR APPROACH | |
| PROVISION OF SERVICE | a) THIS WILL BE A PRECISION RADAR APPROACH RUNWAY (<i>number</i>); b) PRECISION APPROACH NOT AVAILABLE DUE (<i>reason</i>) (<i>alternative instructions</i>); c) IN CASE OF GO AROUND (<i>instructions</i>). |
| COMMUNICATIONS | a) DO NOT ACKNOWLEDGE FURTHER TRANSMISSIONS; b) REPLY NOT RECEIVED. WILL CONTINUE INSTRUCTIONS. |
| AZIMUTH | a) CLOSING [SLOWLY (<i>or</i> QUICKLY)] [FROM THE LEFT (<i>or</i> FROM THE RIGHT)]; b) HEADING IS GOOD; c) ON TRACK; |
| <i>Circumstances</i> | <i>Phraseologies</i> |

ELEVATION

- d) SLIGHTLY (*or WELL, or GOING*) LEFT (*or RIGHT*) OF TRACK;
- e) (*number*) METRES LEFT (*or RIGHT*) OF TRACK.

- a) APPROACHING GLIDE PATH;
- f) COMMENCE DESCENT NOW [AT (*number*) METRES PER SECOND OR (*number*) FEET PER MINUTE (*or ESTABLISH A (number) DEGREE GLIDE PATH*)];
- b) RATE OF DESCENT IS GOOD;
- c) ON GLIDE PATH;
- g) SLIGHTLY (*or WELL, or GOING*) ABOVE (*or BELOW*) GLIDE PATH;
- h) [STILL] (*number*) METRES (*or FEET*) TOO HIGH (*or TOO LOW*);
- d) ADJUST RATE OF DESCENT;
- i) COMING BACK [SLOWLY (*or QUICKLY*)] TO THE GLIDE PATH;
- e) RESUME NORMAL RATE OF DESCENT;
- f) ELEVATION ELEMENT UNSERVICEABLE (*to be followed by appropriate instructions*);
- j) (*distance*) FROM TOUCHDOWN. ALTITUDE (*or HEIGHT*) SHOULD BE (*numbers and units*).

POSITION

- a) (*distance*) FROM TOUCHDOWN;
- b) OVER APPROACH LIGHTS;

*Circumstances**Phraseologies*

| | |
|------------------------|---|
| CHECKS | c) OVER THRESHOLD. |
| | a) CHECK GEAR DOWN AND LOCKED; b) CHECK DECISION ALTITUDE (<i>or</i> HEIGHT). |
| COMPLETION OF APPROACH | a) REPORT VISUAL; b) REPORT RUNWAY [LIGHTS] IN SIGHT; c) APPROACH COMPLETED [CONTACT (<i>unit</i>)]. |
| MISSED APPROACH | a) CONTINUE VISUALLY OR GO AROUND [<i>missed approach instructions</i>]; b) GO AROUND IMMEDIATELY [<i>missed approach instructions</i>] (<i>reason</i>); c) ARE YOU GOING AROUND?; d) IF GOING AROUND (<i>appropriate instructions</i>); e) *GOING AROUND. * Denotes pilot transmission. |

12.4.3 Secondary surveillance radar (SSR) and ADS-B phraseologies

| <i>Circumstances</i> | <i>Phraseologies</i> |
|---|--|
| 12.4.3.1 TO REQUEST THE CAPABILITY OF THE SSR EQUIPMENT | a) ADVISE TRANSPONDER CAPABILITY; b) *TRANSPONDER (<i>as shown in the flight plan</i>); |
| <i>Circumstances</i> | <i>Phraseologies</i> |
| | c) * NEGATIVE TRANSPONDER. * Denotes pilot transmission. |

| | |
|--|--|
| 12.4.3.2 TO REQUEST THE CAPABILITY OF THE ADS-B EQUIPMENT | <p>a) ADVISE ADS-B CAPABILITY;</p> <p>b) * ADS-B TRANSMITTER (<i>data link</i>);</p> <p>c) *ADS-B RECEIVER (<i>data link</i>);</p> <p>d) *NEGATIVE ADS-B.</p> <p>* Denotes pilot transmission.</p> |
| 12.4.3.3 TO INSTRUCT SETTING OF TRANSPONDER | <p>a) FOR DEPARTURE SQUAWK (<i>code</i>);</p> <p>b) SQUAWK (<i>code</i>).</p> |
| 12.4.3.4 TO REQUEST THE PILOT TO RESELECT THE ASSIGNED MODE AND CODE | <p>a) RESET SQUAWK [(<i>mode</i>)] (<i>code</i>);</p> <p>b) *RESETTING (<i>mode</i>) (<i>code</i>).</p> <p>* Denotes pilot transmission.</p> |
| 12.4.3.5 TO REQUEST RESELECTION OF AIRCRAFT IDENTIFICATION | RE-ENTER [ADS-B <i>or</i> MODE S] AIRCRAFT IDENTIFICATION. |
| 12.4.3.6 TO REQUEST THE PILOT TO CONFIRM THE CODE SELECTED ON THE AIRCRAFT'S TRANSPONDER | <p>a) CONFIRM SQUAWK (<i>code</i>);</p> |
| <i>Circumstances</i> | <i>Phraseologies</i> |
| | <p>b) * SQUAWKING (<i>code</i>).</p> <p>* Denotes pilot transmission.</p> |

12.4.3.7 TO REQUEST THE
OPERATION OF THE
IDENT FEATURE

- a) SQUAWK [(code)] [AND] IDENT;
- b) SQUAWK LOW;
- c) SQUAWK NORMAL;
- d) TRANSMIT ADS-B IDENT.

12.4.3.8 TO REQUEST
TEMPORARY
SUSPENSION OF
TRANSPONDER
OPERATION

SQUAWK STANDBY.

12.4.3.9 TO REQUEST
EMERGENCY CODE

SQUAWK MAYDAY [CODE SEVEN-SEVEN-ZERO-ZERO].

12.4.3.10 TO REQUEST
TERMINATION OF
TRANSPONDER
AND/OR ADS-B
TRANSMITTER
OPERATION

- a) STOP SQUAWK [TRANSMIT ADS-B ONLY];
- b) STOP ADS-B TRANSMISSION [SQUAWK (code) ONLY].

Note.— Independent operations of Mode S transponder and ADS-B may not be possible in all aircraft (e.g. where ADS-B is solely provided by 1 090 MHz extended squitter emitted from

Circumstances

the transponder). In such cases, aircraft may not be able to comply with ATC instructions

Phraseologies

| | |
|---|---|
| <i>related to ADS-B operation.</i> | |
| 12.4.3.11 TO REQUEST TRANSMISSION OF PRESSURE-ALTITUDE | a) SQUAWK CHARLIE; b) TRANSMIT ADS-B ALTITUDE. |
| 12.4.3.12 TO REQUEST PRESSURE SETTING CHECK AND CONFIRMATION OF LEVEL | CHECK ALTIMETER SETTING AND CONFIRM (<i>level</i>). |
| 12.4.3.13 TO REQUEST TERMINATION OF PRESSURE-ALTITUDE TRANSMISSION BECAUSE OF FAULTY OPERATION | a) STOP SQUAWK CHARLIE WRONG INDICATION; b) STOP ADS-B ALTITUDE TRANSMISSION [(WRONG INDICATION, <i>or reason</i>)]. |
| 12.4.3.14 TO REQUEST LEVEL CHECK | CONFIRM (<i>level</i>). |
| <i>Note.— See Note to paragraph 12.4.3.10.</i> | |

12.6 AUTOMATIC DEPENDENT SURVEILLANCE — CONTRACT (ADS-C) PHRASEOLOGIES

12.6.1 General ADS-C phraseologies

| <i>Circumstances</i> | <i>Phraseologies</i> |
|----------------------------|--|
| 12.6.1.1 ADS-C DEGRADATION | ADS-C (<i>or</i> ADS-CONTRACT) OUT OF SERVICE (<i>appropriate information as necessary</i>). |

12.7 ALERTING PHRASEOLOGIES

12.7.1 Alerting phraseologies

| <i>Circumstances</i> | <i>Phraseologies</i> |
|-------------------------------|--|
| 12.7.1.1 LOW ALTITUDE WARNING | <i>(aircraft call sign)</i> LOW ALTITUDE WARNING, CHECK YOUR ALTITUDE IMMEDIATELY, QNH IS <i>(number)</i> [<i>(units)</i>]. [THE MINIMUM FLIGHT ALTITUDE IS <i>(altitude)</i>]. |
| 12.7.1.2 TERRAIN ALERT | <i>(aircraft call sign)</i> TERRAIN ALERT, <i>(suggested pilot action, if possible)</i> . |

CHAPTER 13

TRAINING AND RATING PROGRAM

13.1 INTRODUCTION

13.1.1 This Chapter sets out the standards for a Training and Rating program.

13.2 PROGRAM

13.2.1 Technical personnel involved in ATS provision shall be trained adequately, ANSP shall develop and implement training plan and program for all technical staffs.

13.2.2 A Training and Rating program must ensure that an individual performing a function in conjunction with any air traffic services is competent to perform that function.

13.2.3 Processes which address the integrity of staff training must be defined, documented and maintained.

13.3 COMPETENCY

13.3.1 An individual is competent if he/she:

- a. licensed, where the function can only be performed by the holder of a license;
- b. rated, where the function can only be performed by the holder of an appropriate rating;
- c. endorsed, where the function can only be performed by the holder of an appropriate endorsement;
- d. qualified, where the function can only be performed by the holder of an appropriate qualification;
- e. trained and proven to be proficient in the performance of functions that are not covered by subparagraphs (a) to (d) above; and
- f. recent in the performance of the function and knowledge and skills in emerging matters identified as essential to task performance.

13.4 TRAINING COURSES

- 13.4.1** The term ‘training course’ has wide application and includes all training for a particular competency required for the provision of an air traffic service and includes training on new equipments and procedures.
- 13.4.2** Training courses must be provided on the basis of requirement, or training needs analysis or similar method.
- 13.4.3** The training programs for each course must be comprehensive and facilitate achievement of training goals through a syllabus, which reflects required competencies. The syllabus must ensure compliance with the syllabus set forth in the Manual of Standards for Licensing/Rating of ATC Personnel.
- 13.4.4** Training courses must use a method of delivery consistent with requirements for an ATO, using facilities and instructors, or On-the Job Training Instructor (OJTI), with current expertise and identified qualifications appropriate to achieving the goals of the course.
- 13.4.5** The method of assessment, both theoretical and practical, must utilize qualified assessors and appropriate processes and facilities and must be consistent.

13.5 UNIT TRAINING

13.5.1 Unit Training Plan

Every air traffic control unit must have a Unit Training Plan (UTP), approved by the

Licensing Authority. The UTP will detail the processes by which student air traffic controllers are trained. Student air traffic controllers will require specific unit training in addition to basic training. The ANSP shall notify the Licensing Authority when a student air traffic controller commences unit training.

13.5.2 Phases of unit training

Unit training varies from the student air traffic controller being required to become familiar with the local area and unit procedures, to complex courses using simulations to prepare for high traffic levels and/or complex unit procedures. Unit training is divided into three phases:

- a. transitional training;
- b. pre on-the-job training;
- c. on-the-job training.

Note: Controllers who have valid license/or rating applying for new unit rating shall also pass through phases of unit training as mentioned above.

13.5.2.1 Transitional Training

Transitional training must adequately prepare student air traffic controllers for pre on-the-job training. Following basic training, this phase of training imparts site specific theoretical knowledge and understanding which is transferred to the student air traffic controller by an OJTI using a variety of methods.

13.5.2.2 Pre On-the-Job Training (Pre-OJT)

Pre on-the-job training must adequately prepare student air traffic controllers for OJT. This is the phase of locally based training conducted by an OJT Instructor, during which extensive use is made of simulation, using site-specific facilities, to enhance the development of previously acquired routines and abilities to prepare student air traffic controllers to commence OJT.

13.5.2.3 On-the-Job Training (OJT)

OJT must prepare a student air traffic controller to a level of operational proficiency such that he/she is able to provide an air traffic control service in an unsupervised capacity. This phase of training commences following completion of pre on-the-job training. During this phase, student air traffic controllers practice the integration of previously acquired job-related routines and skills to provide an air traffic control service under the supervision of an OJTI/Rated Controller in a live traffic environment.

13.5.3 Administrative procedures

13.5.3.1 The ANSP shall submit a draft of its UTP to the Licensing Authority as appropriate for approval.

13.5.3.2 The ANSP must notify Licensing Authority of any proposed changes and amendments to the approved UTP in order to obtain continued approval.

13.5.3.3 The ANSP shall retain the complete training records for all student air traffic controllers which should include records of transitional, pre-OJT, OJT training and validation examination.

13.6 EMERGENCY TRAINING

13.6.1 Emergency training to specifically prepare a candidate for unforeseen circumstances must form part of all training courses.

13.6.2 Emergency training shall include, but not limited to the following:

Pressurization Failure and Emergency Descent

Unlawful Interference - aircraft hijack

Brake Problem

Communication Failure

Hydraulic Failure

Engine Failure

Bird Strike

Fuel Dumping

Landing Gear Problem

Urgency Message

13.7 REFRESHER TRAINING

13.7.1 Refresher training is part of the Training and Rating program. It involves periodic training (at least once in two years) and assessment of individuals performing functions in air traffic services

in those competencies (knowledge and skills) which are essential, but infrequently or rarely used (e.g. abnormal and emergency operations, degraded equipment modes, contingency plan implementation). The content and periodicity of refresher training must be sufficient to ensure competency and has to be mentioned in concerned ATS Operation Manual.

13.8 ON-GOING TRAINING

13.8.1 The training and checking program must provide for on-going training, as necessary, to ensure that staff are competent in the use of new or emerging standards, procedures, techniques, facilities and equipment identified as essential to task performance.

13.9 REMEDIAL TRAINING

13.9.1 The training and checking program must have a process which identifies deficiencies in knowledge or application, and must have a process to ensure these deficiencies are rectified.

13.10 CHECKING

13.10.1 The purpose of checking is to ensure that the individual subject to the check meets the competency standards, and the concerned ATS unit's own standards where these are additional. Checks must be carried out as required.

13.11 RATING

Categories for the ratings for the Air Traffic Controller shall be the following:

- a. Aerodrome Control Rating
- b. Approach Control Procedural Rating
- c. Approach Control Surveillance Rating
- d. Area Control Procedural Rating
- e. Area Control Surveillance Rating

13.12 QUALIFICATIONS OF OJTI AND DCATCO

13.12.1 Qualifications of OJTI and DCATCO shall be in accordance with Manual of Standards for Licensing/Rating of ATC Personnel.

13.12.2 An ANSP shall avoid situations where the persons giving the instruction are also responsible for examining the student on completion of the instruction.

CHAPTER 14

ATS OPERATIONS MANUAL

14.1 INTRODUCTION

14.1.1 An Air Traffic Service Operations Manual shows how and where Air Traffic Services are provided by different ATS Units.

14.2 CONTENT OF THE ATS OPERATIONS MANUAL

14.2.1 An ATS operations manual must contain:

- a. a table of contents based on the items in the manual, indicating the page number on which each item begins;
- b. a description of the provider's organizational structure and a statement setting out the functions that the provider performs, or proposes to perform;
- c. a description of the chain of command established, or proposed to be established, by the provider and a statement of the duties and responsibilities of any supervisory positions within the organizational structure;
- d. a statement showing how the provider determines the number of operational staff required including the number of operational supervisory staff;
- e. a list of the air traffic services that the provider provides, or proposes to provide;
- f. a statement for each air traffic service, showing the hours of operation of the service;
- g. a statement, for each air traffic service, that identifies the particular airspace within which the service is provided, or proposed to be provided;
- h. a statement, for each air traffic service, that identifies the location from where the service is provided, or proposed to be provided;
- i. if the provider provides, or proposes to provide, an air traffic service for a controlled

aerodrome:

- i. a description of the manoeuvring area of the aerodrome; and
- ii. copy of the parts of the aerodrome emergency plan, set out in the aerodrome manual that are relevant to the provision of the service; and
- iii. a copy of the procedures set out in the aerodrome manual for preventing the unauthorised entry of persons or things onto the manoeuvring area of the aerodrome; and
- iv. a copy of the procedures set out in the aerodrome manual for the control of surface vehicles operating on or in the vicinity of the manoeuvring area;
- j. a statement of the responsibilities and functions for each operating position;
- k. a description of the arrangements made or proposed to be made by the provider to ensure that it has, and will continue to receive, on a daily basis, the information necessary for providing the service;
- l. a description of the arrangements made or proposed to be made by the provider to ensure that it has, and will continue to be able to provide, information in connection with its air traffic services to another person whose functions reasonably require that information (includes SAR alerting);
- m. a description of the provider's document and record keeping system;
- n. a copy of any agreement entered into by the provider in relation to the provision of any of the air traffic services;
- o. a copy of the document that sets out the provider's safety management system;
- p. a copy of the provider's contingency plan;
- q. a description of the processes and documentation used to present to staff the relevant standards, rules and procedures contained in CAR 10, CAR 11, ICAO PANS-ATM, ICAO Regional

Supplementary Procedures, Chapter 10 of this Manual of ATS Nepal, and any of the provider's site-specific instructions for the provision of air traffic services;

- r. a description of the processes and documentation used to provide operational instructions to staff;
- s. a description of the procedures to be followed to ensure all operational staff are familiar with any operational changes that have been issued since they last performed operational duties;
- t. a description of the provider's training and checking program;
- u. a description of the procedures to be used in commissioning new facilities, equipment and services;
- v. the procedures to be followed for revising the operations manual.
- w. Operational Letter of agreement between different ATS units required for the provision of air traffic services within its jurisdiction.
- x. LOA or Coordination procedure with Adjacent FIRs, Operators, MET, AIS, Military Authority as applicable.
- y. Any other procedures that details the adoption of the provisions of MATS Nepal that are not covered above.

14.2.2 ATS Operational manual is an important document and shall be issued under authority of the ANSP. The ANSP shall control the distribution of the operations manual and ensure that it is amended whenever necessary to maintain the accuracy of the information in the operations manual and to keep its content up to date.

CHAPTER 15

ATS OPERATIONS MANUAL

15.1 EMERGENCY PROCEDURES

15.1.1 General

15.1.1.1. The various circumstances surrounding each emergency situation preclude the establishment of exact detailed procedures to be followed. The procedures outlined herein are intended as a general guide to air traffic services personnel. Air traffic control units shall maintain full and complete coordination, and personnel shall use their best judgement in handling emergency situations.

Note 1.— Additional procedures to be applied in relation to emergencies and contingencies while using an ATS surveillance system are contained in Chapter 8, 8.8.1.

Note 2.— If the pilot of an aircraft encountering a state of emergency has previously been directed by ATC to select a specific transponder code and/or a specific ADS-B emergency mode, that code and/or mode will normally be maintained unless, in special circumstances, the pilot has decided or has been advised otherwise. Where ATC has not requested a code or emergency mode to be set, the pilot will set the transponder to Mode A Code 7700 and/or the appropriate ADS-B emergency mode.

Note 3.— Some aircraft equipped with first generation ADS-B avionics have the capability to transmit a general emergency alert only, regardless of the code selected by the pilot.

Note 4.— Some aircraft equipped with first generation ADS-B avionics do not have the capability of squawking IDENT while the emergency and/or urgency mode is selected.

15.1.1.2. When an emergency is declared by an aircraft, the ATS unit should take appropriate and relevant action as follows:

- a. unless clearly stated by the flight crew or otherwise known, take all necessary steps to ascertain aircraft identification and type, the type of emergency, the intentions of the flight crew as well as the position and level of the aircraft;

- b. decide upon the most appropriate type of assistance which can be rendered;
- c. enlist the aid of any other ATS unit or other services which may be able to provide assistance to the aircraft;
- d. provide the flight crew with any information requested as well as any additional relevant information, such as details on suitable aerodromes, minimum safe altitudes, weather information;
- e. obtain from the operator or the flight crew such of the following information as may be relevant: number of persons on board, amount of fuel remaining, possible presence of hazardous materials and the nature thereof; and
- f. notify the appropriate ATS units and authorities as specified in local instructions.

15.1.1.3. Changes of radio frequency and SSR code should be avoided if possible and should normally be made only when or if an improved service can be provided to the aircraft concerned. Manoeuvring instructions to an aircraft experiencing engine failure should be limited to a minimum. When appropriate, other aircraft operating in the vicinity of the aircraft in emergency should be advised of the circumstances.

Note.— Requests to the flight crew for the information contained in 15.1.1.2 e) will be made only if the information is not available from the operator or from other sources and will be limited to essential information.

15.1.2 Priority

An aircraft known or believed to be in a state of emergency, including being subjected to unlawful interference, shall be given priority over other aircraft.

15.1.3 Unlawful interference and aircraft bomb threat

15.1.3.1. Air traffic services personnel shall be prepared to recognize any indication of the occurrence of unlawful interference with an aircraft.

15.1.3.2. Whenever unlawful interference with an aircraft is suspected, and where automatic

distinct display of SSR Mode A Code 7500 and Code 7700 is not provided, the controller shall attempt to verify any suspicion by setting the SSR decoder to Mode A Code 7500 and thereafter to Code 7700.

Note.— An aircraft equipped with an SSR transponder is expected to operate the transponder on Mode A Code 7500 to indicate specifically that it is the subject of unlawful interference. The aircraft may operate the transponder on Mode A Code 7700, to indicate that it is threatened by grave and imminent danger and requires immediate assistance. An aircraft equipped with other surveillance system transmitters, including ADS-B and ADS-C, might send the emergency and/or urgency signal by all of the available means.

15.1.3.3. Whenever unlawful interference with an aircraft is known or suspected or a bomb threat warning has been received, ATS units shall promptly attend to requests by, or to anticipated needs of, the aircraft, including requests for relevant information relating to air navigation facilities, procedures and services along the route of flight and at any aerodrome of intended landing, and shall take such action as is necessary to expedite the conduct of all phases of the flight.

15.1.3.3.1. ATS units shall also:

- a. transmit, and continue to transmit, information pertinent to the safe conduct of the flight, without expecting a reply from the aircraft;
- b. monitor and plot the progress of the flight with the means available, and coordinate transfer of control with adjacent ATS units without requiring transmissions or other responses from the aircraft, unless communication with the aircraft remains normal;
- c. inform, and continue to keep informed, appropriate ATS units, including those in adjacent FIRs, which may be concerned with the progress of the flight;

Note.— In applying this provision, account must be taken of all the factors which may affect the progress of the flight, including fuel endurance and the possibility of sudden changes in route and destination. The objective is to provide, as far in advance as is practicable in the circumstances, each ATS unit with appropriate information as to the expected or possible

penetration of the aircraft into its area of responsibility.

d. notify:

- i. the operator or its designated representative;
- ii. the appropriate rescue coordination centre in accordance with appropriate alerting procedures;
- iii. the appropriate authority designated by the State;

Note.— It is assumed that the designated security authority and/or the operator will in turn notify other parties concerned in accordance with pre-established procedures.

e. relay appropriate messages, relating to the circumstances associated with the unlawful interference, between the aircraft and designated authorities.

Note.— These messages include, but are not limited to: initial messages declaring an incident; update messages on an existing incident; messages containing decisions made by appropriate decision makers; messages on transfer of responsibility; messages on acceptance of responsibility; messages indicating that an entity is no longer involved in an incident; and messages closing an incident.

15.1.3.4. The following additional procedures shall apply if a threat is received indicating that a bomb or other explosive device has been placed on board a known aircraft. The ATS unit receiving the threat information shall:

- a. if in direct communication with the aircraft, advise the flight crew without delay of the threat and the circumstances surrounding the threat; or
- b. if not in direct communication with the aircraft, advise the flight crew by the most expeditious means through other ATS units or other channels.

15.1.3.5. The ATS unit in communication with the aircraft shall ascertain the intentions of the flight crew and report those intentions to other ATS units which may be concerned with the flight.

- 15.1.3.6. The aircraft shall be handled in the most expeditious manner while ensuring, to the extent possible, the safety of other aircraft and that personnel and ground installations are not put at risk.
- 15.1.3.7. Aircraft in flight shall be given re-clearance to a requested new destination without delay. Any request by the flight crew to climb or descend for the purpose of equalizing or reducing the differential between the outside air pressure and the cabin air pressure shall be approved as soon as possible.
- 15.1.3.8. An aircraft on the ground should be advised to remain as far away from other aircraft and installations as possible and, if appropriate, to vacate the runway. The aircraft should be instructed to taxi to a designated or isolated parking area in accordance with local instructions. Should the flight crew disembark passengers and crew immediately, other aircraft, vehicles and personnel should be kept at a safe distance from the threatened aircraft.
- 15.1.3.9. ATS units shall not provide any advice or suggestions concerning action to be taken by the flight crew in relation to an explosive device.
- 15.1.3.10. An aircraft known or believed to be the subject of unlawful interference or which for other reasons needs isolation from normal aerodrome activities shall be cleared to the designated isolated parking position. Where such an isolated parking position has not been designated, or if the designated position is not available, the aircraft shall be cleared to a position within the area or areas selected by prior agreement with the aerodrome authority. The taxi clearance shall specify the taxi route to be followed to the parking position. This route shall be selected with a view to minimizing any security risks to the public, other aircraft and installations at the aerodrome.

Note.— See Annex 14, Volume I, Chapter 3.

15.1.4 Emergency descent

15.1.4.1. ACTION BY THE ATS UNIT

Upon recognition that an aircraft is making an emergency descent, all appropriate action shall be taken immediately to safeguard all aircraft concerned. Appropriate actions may include the following, in the order appropriate for the circumstance:

- a. broadcasting an emergency message;
- b. issuing traffic information and/or instructions to aircraft affected by the descent;
- c. advising the minimum flight altitude and altimeter setting for the area of operation; and
- d. informing any other ATS units which may be affected by the emergency descent.

ACTION BY THE PILOT OF THE AIRCRAFT IN AN EMERGENCY DESCENT

The pilot shall take the following steps as soon as practicable in the order appropriate for the circumstance:

- a. navigate as deemed appropriate by the pilot;
- b. advise the appropriate ATS unit of the emergency descent and, if able, intentions;
- c. set transponder to Code 7700 and, if applicable, select the appropriate emergency mode on ADS -B and/or ADS-C;
- d. turn on aircraft exterior lights (commensurate with appropriate operating limitations);
- e. watch for conflicting traffic both visually and by reference to ACAS (if equipped); and
- f. when emergency descent is complete, coordinate further intentions with the appropriate ATS unit.

Note.— Procedures for the use of ACAS are contained in PANS-OPS, Volume I, Part III, Section 3, Chapter 3.

ACTION BY THE PILOT OF THE AIRCRAFT RECEIVING EMERGENCY DESCENT BROADCAST

Unless specifically instructed by the ATS unit to clear the area or threatened by immediate danger, the pilot shall take the following actions:

- a. continue according to current clearance and maintain listening watch on the frequency in use for any further instructions from the ATS unit; and
- b. watch for conflicting traffic both visually and by reference to ACAS (if equipped).

15.2 AIR-GROUND COMMUNICATIONS FAILURE

Note 1.— Procedures to be applied in relation to an aircraft experiencing air-ground communication failure when providing ATS surveillance services are contained in Chapter 8, Section 8.8.3.

Note 2.— An aircraft equipped with an SSR transponder is expected to operate the transponder on Mode A Code 7600 to indicate that it has experienced air-ground communication failure. An aircraft equipped with other surveillance system transmitters, including ADS-B and ADS-C, might indicate the loss of air-ground communication by all of the available means.

Note 3.— Some aircraft equipped with first generation ADS-B avionics have the capability to transmit a general emergency alert only, regardless of the code selected by the pilot.

Note 4.— See also Chapter 6, 6.3.2.5, concerning departure clearances containing no geographical or time limit for a cleared level below the flight planned level and procedures to be applied in relation to an aircraft experiencing air-ground communication failure under such circumstances.

Note 5. — See also Chapter 5, 5.4.2.6.3.2, for additional requirements applying to communication failure during the application of the 50 NM longitudinal RNAV/RNP 10 separation minimum.

15.2.1 Action by air traffic control units when unable to maintain two-way communication with an aircraft operating in a control area or control zone shall be as outlined in the paragraphs which follow.

15.2.2 As soon as it is known that two-way communication has failed, action shall be taken to ascertain whether the aircraft is able to receive transmissions from the air traffic control unit by requesting

it to execute a specified manoeuvre which can be observed by an ATS surveillance system or to transmit, if possible, a specified signal in order to indicate acknowledgement.

Note.— Some aircraft equipped with first generation ADS-B avionics do not have the capability of squawking IDENT while the emergency and/or urgency mode is selected.

15.2.3 If the aircraft fails to indicate that it is able to receive and acknowledge transmissions, separation shall be maintained between the aircraft having the communication failure and other aircraft, based on the assumption that the aircraft will:

- a. if in visual meteorological conditions:
 1. continue to fly in visual meteorological conditions;
 2. land at the nearest suitable aerodrome; and
 3. report its arrival by the most expeditious means to the appropriate air traffic control unit; or
- b. if in instrument meteorological conditions or when conditions are such that it does not appear likely that the pilot will complete the flight in accordance with a):
 1. unless otherwise prescribed on the basis of a regional air navigation agreement, in airspace where procedural separation is being applied, maintain the last assigned speed and level, or minimum flight altitude if higher, for a period of 20 minutes following the aircraft's failure to report its position over a compulsory reporting point and thereafter adjust level and speed in accordance with the filed flight plan; or
 2. in airspace where an ATS surveillance system is used in the provision of air traffic control, maintain the last assigned speed and level, or minimum flight altitude if higher, for a period of 7 minutes following:
 - i. the time the last assigned level or minimum flight altitude is reached; or
 - ii. the time the transponder is set to Code 7600 or the ADS-B transmitter is set to indicate the loss of air-ground communications; or

- iii. the aircraft's failure to report its position over a compulsory reporting point; whichever is later and thereafter adjust level and speed in accordance with the filed flight plan;
3. when being vectored or having been directed by ATC to proceed offset using RNAV without a specified limit, proceed in the most direct manner possible to rejoin the current flight plan route no later than the next significant point, taking into consideration the applicable minimum flight altitude;
4. proceed according to the current flight plan route to the appropriate designated navigation aid or fix serving the destination aerodrome and, when required to ensure compliance with 5), hold over this aid or fix until commencement of descent;
5. commence descent from the navigation aid or fix specified in 4) at, or as close as possible to, the expected approach time last received and acknowledged; or, if no expected approach time has been received and acknowledged, at, or as close as possible to, the estimated time of arrival resulting from the current flight plan;
6. complete a normal instrument approach procedure as specified for the designated navigation aid or fix; and
7. land, if possible, within 30 minutes after the estimated time of arrival specified in 5) or the last acknowledged expected approach time, whichever is later.

Note 1.— Provisions related to minimum levels are contained in CAR 2, 5.1.2.

Note 2.— As evidenced by the meteorological conditions prescribed therein, 15.3.3 a) relates to all controlled flights, whereas 15.3.3 b) relates only to IFR flights.

Note 3.— See also 8.6.5.1 b) concerning the requirement for the flight crew to be informed of what a vector is to accomplish and the limit of the vector.

15.2.4 Action taken to ensure suitable separation shall cease to be based on the assumption stated in 15.2.3 when:

- a. it is determined that the aircraft is following a procedure differing from that in 15.2.3; or

- b. through the use of electronic or other aids, air traffic control units determine that action differing from that required by 15.2.3 may be taken without impairing safety; or
- c. positive information is received that the aircraft has landed.

15.2.5 As soon as it is known that two-way communication has failed, appropriate information describing the action taken by the air traffic control unit, or instructions justified by any emergency situation, shall be transmitted blind for the attention of the aircraft concerned, on the frequencies available on which the aircraft is believed to be listening, including the voice frequencies of available radio navigation or approach aids. Information shall also be given concerning:

- a. meteorological conditions favourable to a cloud-breaking procedure in areas where congested traffic may be avoided; and
- b. meteorological conditions at suitable aerodromes.

15.2.6 Pertinent information shall be given to other aircraft in the vicinity of the presumed position of the aircraft experiencing the failure.

15.2.7 As soon as it is known that an aircraft which is operating in its area of responsibility is experiencing an apparent radio communication failure, an air traffic services unit shall forward information concerning the radio communication failure to all air traffic services units concerned along the route of flight. The ACC in whose area the destination aerodrome is located shall take steps to obtain information on the alternate aerodrome(s) and other relevant information specified in the filed flight plan, if such information is not available.

15.2.8 If circumstances indicate that a controlled flight experiencing a communication failure might proceed to (one of) the alternate aerodrome(s) specified in the filed flight plan, the air traffic control unit(s) serving the alternate aerodrome(s) and any other air traffic control units that might be affected by a possible diversion shall be informed of the circumstances of the failure and requested to attempt to establish communication with the aircraft at a time when the aircraft could possibly be within communication range. This shall apply particularly when, by agreement with the operator or a designated representative, a clearance has been transmitted blind to the

aircraft concerned to proceed to an alternate aerodrome, or when meteorological conditions at the aerodrome of intended landing are such that a diversion to an alternate is considered likely.

15.2.9 When an air traffic control unit receives information that an aircraft, after experiencing a communication failure has re-established communication or has landed, that unit shall inform the air traffic services unit in whose area the aircraft was operating at the time the failure occurred, and other air traffic services units concerned along the route of flight, giving necessary information for the continuation of control if the aircraft is continuing in flight.

15.2.10 If the aircraft has not reported within thirty minutes after:

- a. the estimated time of arrival furnished by the pilot;
- b. the estimated time of arrival calculated by the ACC; or
- c. the last acknowledged expected approach time,

whichever is latest, pertinent information concerning the aircraft shall be forwarded to aircraft operators, or their designated representatives, and pilots-in-command of any aircraft concerned and normal control resumed if they so desire. It is the responsibility of the aircraft operators, or their designated representatives, and pilots-in-command of aircraft to determine whether they will resume normal operations or take other action.

15.3 ASSISTANCE TO VFR FLIGHTS

15.3.1 Strayed VFR flights and VFR flights encountering adverse meteorological conditions

Note.—A strayed aircraft is an aircraft which has deviated significantly from its intended track or which reports that it is lost.

15.3.1.1 A VFR flight reporting that it is uncertain of its position or lost, or encountering adverse meteorological conditions, should be considered to be in a state of emergency and handled as such. The controller shall, under such circumstances, communicate in a clear, concise and calm manner and care shall be taken, at this stage, not to question any fault or negligence that the pilot may have committed in the preparation or conduct of the flight. Depending on

the circumstances, the pilot should be requested to provide any of the following information considered pertinent so as to better provide assistance:

- a. aircraft flight conditions;
- b. position (if known) and level;
- c. airspeed and heading since last known position, if pertinent;
- d. pilot experience;
- e. navigation equipment carried and if any navigation aid signals are being received;
- f. SSR mode and code selected if relevant;
- g. ADS-B capability;
- h. departure and destination aerodromes;
- i. number of persons on board;
- j. endurance.

15.3.1.2 If communications with the aircraft are weak or distorted, it should be suggested that the aircraft climb to a higher level, provided meteorological conditions and other circumstances permit.

15.3.1.3 Navigation assistance to help the pilot determine the aircraft position may be provided by use of an ATS surveillance system, direction-finder, navigation aids or sighting by another aircraft. Care must be taken when providing navigation assistance to ensure that the aircraft does not enter cloud.

Note.—The possibility of a VFR flight becoming strayed as a result of encountering adverse meteorological conditions must be recognized.

15.3.1.4 The pilot should be provided with reports and information on suitable aerodromes in the vicinity where visual meteorological conditions exist.

- 15.3.1.5 If reporting difficulty in maintaining or unable to maintain VMC, the pilot should be informed of the minimum flight altitude of the area where the aircraft is, or is believed to be. If the aircraft is below that level, and the position of the aircraft has been established with a sufficient degree of probability, a track or heading, or a climb, may be suggested to bring the aircraft to a safe level.
- 15.3.1.6 Assistance to a VFR flight should only be provided using an ATS surveillance system upon the request or concurrence of the pilot. The type of service to be provided should be agreed with the pilot.
- 15.3.1.7 When providing such assistance in adverse meteorological conditions, the primary objective should be to bring the aircraft into VMC as soon as possible. Caution must be exercised to prevent the aircraft from entering cloud.
- 15.3.1.8 Should circumstances be such that IMC cannot be avoided by the pilot, the following guidelines may be followed:
- a. other traffic on the ATC frequency not able to provide any assistance may be instructed to change to another frequency to ensure uninterrupted communications with the aircraft; alternatively the aircraft being assisted may be instructed to change to another frequency;
 - b. ensure, if possible, that any turns by the aircraft are carried out clear of cloud;
 - c. instructions involving abrupt manoeuvres should be avoided; and
 - d. instructions or suggestions to reduce speed of the aircraft or to lower the landing gear, should, if possible, be carried out clear of cloud.

15.4 OTHER IN-FLIGHT CONTINGENCIES

Note.— The texts of 15.5.1 and 15.5.2 are reproduced from CAR 11, Chapter 2, and have the status of Standards.

15.4.1 Strayed or unidentified aircraft

Note 1.— The terms “strayed aircraft” and “unidentified aircraft” in this paragraph have the

following meanings:

- a. Strayed aircraft. An aircraft which has deviated significantly from its intended track or which reports that it is lost.*
- b. Unidentified aircraft. An aircraft which has been observed or reported to be operating in a given area but whose identity has not been established.*

Note 2.— An aircraft may be considered, at the same time, as a “strayed aircraft” by one unit and as an “unidentified aircraft” by another unit.

Note 3.— A strayed or unidentified aircraft may be suspected as being the subject of unlawful interference. See CAR 11, 2.24.1.3.

15.4.1.1 As soon as an air traffic services unit becomes aware of a strayed aircraft, it shall take all necessary steps as outlined in 15.4.1.1.1 and 15.4.1.1.2 to assist the aircraft and to safeguard its flight.

Note.— Navigational assistance by an air traffic services unit is particularly important if the unit becomes aware of an aircraft straying, or about to stray, into an area where there is a risk of interception or other hazard to its safety.

15.4.1.2.1 If the aircraft's position is not known, the air traffic services unit shall:

- a. attempt to establish two-way communication with the aircraft, unless such communication already exists;
- b. use all available means to determine its position;
- c. inform other ATS units into whose area the aircraft may have strayed or may stray, taking into account all the factors which may have affected the navigation of the aircraft in the circumstances;
- d. inform, in accordance with locally agreed procedures, appropriate military units and provide them with pertinent flight plan and other data concerning the strayed aircraft;
- e. request from the units referred to in c) and d) and from other aircraft in flight every

assistance in establishing communication with the aircraft and determining its position.

Note.— The requirements in d) and e) apply also to ATS units informed in accordance with c).

15.4.1.2.2 When the aircraft's position is established, the air traffic services unit shall:

- a. advise the aircraft of its position and corrective action to be taken; and
- b. provide, as necessary, other ATS units and appropriate military units with relevant information concerning the strayed aircraft and any advice given to that aircraft.

15.4.1.2 As soon as an air traffic services unit becomes aware of an unidentified aircraft in its area, it shall endeavor to establish the identity of the aircraft whenever this is necessary for the provision of air traffic services or required by the appropriate military authorities in accordance with locally agreed procedures. To this end, the air traffic services unit shall take such of the following steps as are appropriate in the circumstances:

- a. attempt to establish two-way communication with the aircraft;
- b. inquire of other air traffic services units within the FIR about the flight and request their assistance in establishing two-way communication with the aircraft;
- c. inquire of air traffic services units serving the adjacent FIRs about the flight and request their assistance in establishing two-way communication with the aircraft;
- d. attempt to obtain information from other aircraft in the area.

15.4.1.2.1 The air traffic services unit shall, as necessary, inform the appropriate military unit as soon as the identity of the aircraft has been established.

Note.— Requirements for coordination between military authorities and air traffic services are specified in CAR 11, 2.16.

15.4.1.3 Should the ATS unit consider that a strayed or unidentified aircraft may be the subject of unlawful interference, the appropriate authority designated by the State shall immediately

be informed, in accordance with locally agreed procedures.

15.4.2 Unauthorized entry into Nepalese Airspace

15.4.2.1 As soon as an air traffic services unit learns that an aircraft has entered Nepalese airspace without getting permission from CAAN, it shall instruct aircraft to land at Tribhuvan International Airport (TIA). If the aircraft does not comply with the ATC instruction to land at TIA then the ATS Unit shall:

- a. Determine the identity, position and purpose of entry into Nepalese airspace.
- b. Notify the aircraft about its unauthorized entry and instruct the aircraft to leave the Nepalese airspace immediately.
- c. Inform the State of adjacent FIR.
- d. Inform the State of Operator and State of Registry.
- e. Inform the departure aerodrome.
- f. Inform the Airport Security Committee/ military authority.
- g. Inform DGCA of Nepal and other concerned.

15.4.3 Fuel dumping

15.4.3.1 GENERAL

15.4.3.1.1 An aircraft in an emergency or other urgent situations may need to dump fuel so as to reduce to maximum landing mass in order to effect a safe landing.

15.4.3.1.2 When an aircraft operating within controlled airspace needs to dump fuel, the flight crew shall advise ATC. The ATC unit should then coordinate with the flight crew the following:

- a. the route to be flown, which, if possible, should be clear of cities and towns, preferably over water and away from areas where thunderstorms have been reported or

are expected;

- b. the level to be used, which should be not less than 1 800 m (6 000 ft); and
- c. the duration of the fuel dumping.

15.4.3.2 SEPARATION

Other known traffic should be separated from the aircraft dumping fuel by:

- a. at least 19 km (10 NM) horizontally, but not behind the aircraft dumping fuel;
- b. vertical separation if behind the aircraft dumping fuel within 15 minutes flying time or a distance of 93 km (50 NM) by:
 - 1. at least 300 m (1 000 ft) if above the aircraft dumping fuel; and
 - 2. at least 900 m (3 000 ft) if below the aircraft dumping fuel.

Note.—The horizontal boundaries of the area within which other traffic requires appropriate vertical separation extend for 19 km (10 NM) either side of the track flown by the aircraft which is dumping fuel, from 19 km (10 NM) ahead, to 93 km (50 NM) or 15 minutes along track behind it (including turns).

15.4.3.3 COMMUNICATIONS

If the aircraft will maintain radio silence during the fuel dumping operation, the frequency to be monitored by the flight crew and the time when radio silence will terminate should be agreed.

15.4.3.4 INFORMATION TO OTHER ATS UNITS AND NON-CONTROLLED TRAFFIC

15.4.3.4.1 A warning message shall be broadcast on appropriate frequencies for non-controlled traffic to remain clear of the area concerned. Adjacent ATC units and control sectors should be informed of the fuel dumping taking place and requested to broadcast on applicable frequencies an appropriate warning message for other traffic to remain clear of the area concerned.

15.4.3.4.2 Upon completion of the fuel dumping, adjacent ATC units and control sectors should be advised that normal operations can be resumed.

15.4.4 Fuel emergency and minimum fuel

Note 1.— General procedures to be applied when a pilot reports an emergency situation are contained in 15.1.1 and 15.1.2.

Note 2.— Coordination procedures to be applied between transferring and accepting ATS units for flights in fuel emergency or minimum fuel situations are contained in Chapter 10, 10.2.5. Note 3.— The words MAYDAY FUEL describe the nature of the distress condition as required in Annex 10, Volume II, 5.3.2.1.1 b) 3.

15.4.4.1 When a pilot reports a state of minimum fuel, the controller shall inform the pilot as soon as practicable of any anticipated delays or that no delays are expected.

Note.— The declaration of MINIMUM FUEL informs ATC that all planned aerodrome options have been reduced to a specific aerodrome of intended landing, and any change to the existing clearance may result in landing with less than planned final reserve fuel. This is not an emergency situation but an indication that an emergency situation is possible should any additional delay occur.

15.4.5 Descents by supersonic aircraft due to solar cosmic radiation

Air traffic control units should be prepared for the possibility that supersonic aircraft operating at levels above 15 000 m (49 000 ft) may, on rare occasions, experience a rise in solar cosmic radiation which requires them to descend to lower levels, possibly down to or below the levels being used by subsonic aircraft. When such a situation is known or suspected, air traffic control units should take all possible action to safeguard all aircraft concerned, including any subsonic aircraft affected by the descent.

Note.— All supersonic aircraft in a particular portion of airspace will be affected at the same time, and the event may be accompanied by a deterioration or loss of air-ground communications. It is expected that the aircraft will alert air traffic control units before the radiation reaches a critical level and will request a descent clearance when the critical level is reached. However,

situations may occur in which the aircraft will need to descend without waiting for a clearance. In such cases, the aircraft are expected to advise air traffic control units, as soon as possible, of the emergency action taken.

15.5 OTHER IN FLIGHT CONTINGENCIES

The various circumstances surrounding each contingency situation preclude the establishment of exact detailed procedures to be followed. The procedures outlined below are intended as a general guide to air traffic services personnel.

15.5.1 Radio communications contingencies

15.5.1.1 GENERAL

ATC contingencies related to communications, i.e. circumstances preventing a controller from communicating with aircraft under control, may be caused by either a failure of ground radio equipment, a failure of airborne equipment, or by the control frequency being inadvertently blocked by an aircraft transmitter. The duration of such events may be for prolonged periods and appropriate action to ensure that the safety of aircraft is not affected should therefore be taken immediately.

15.5.1.2 GROUND RADIO FAILURE

15.5.1.2.1 In the event of complete failure of the ground radio equipment used for ATC, the controller shall:

- a. where aircraft are required to keep a listening watch on the emergency frequency 121.5 MHz, attempt to establish radio communications on that frequency;
- b. without delay inform all adjacent control positions or ATC units, as applicable, of the failure;
- c. appraise such positions or units of the current traffic situation;
- d. if practicable, request their assistance, in respect of aircraft which may establish communications with those positions or units, in establishing separation between and

maintaining control of such aircraft; and

- e. instruct adjacent control positions or ATC units to hold or re-route all controlled flights outside the area of responsibility of the position or ATC unit that has experienced the failure until such time that the provision of normal services can be resumed.

15.5.1.2.2 In order to reduce the impact of complete ground radio equipment failure on the safety of air traffic, the appropriate ATS authority should establish contingency procedures to be followed by control positions and ATC units in the event of such failures. Where feasible and practicable, such contingency procedures should provide for the delegation of control to an adjacent control position or ATC unit in order to permit a minimum level of services to be provided as soon as possible, following the ground radio failure and until normal operations can be resumed.

15.5.1.3 BLOCKED FREQUENCY

In the event that the control frequency is inadvertently blocked by an aircraft transmitter, the following additional steps should be taken:

- a. attempt to identify the aircraft concerned;
- b. if the aircraft blocking the frequency is identified, attempts should be made to establish communication with that aircraft, e.g. on the emergency frequency 121.5 MHz, by SELCAL, through the aircraft operator's company frequency if applicable, on any VHF frequency designated for air-to-air use by flight crews or any other communication means or, if the aircraft is on the ground, by direct contact;
- c. if communication is established with the aircraft concerned, the flight crew shall be instructed to take immediate action to stop inadvertent transmissions on the affected control frequency.

15.5.1.4 UNAUTHORIZED USE OF ATC FREQUENCY

15.5.1.4.1 Instances of false and deceptive transmissions on ATC frequencies which may impair the safety of aircraft can occasionally occur. In the event of such occurrences, the ATC

unit concerned should:

- a. correct any false or deceptive instructions or clearances which have been transmitted;
- b. advise all aircraft on the affected frequency(ies) that false and deceptive instructions or clearances are being
- c. transmitted; instruct all aircraft on the affected frequency(ies) to verify instructions and clearances before taking action to comply;
- d. if practical, instruct aircraft to change to another frequency; and
- e. if possible, advise all aircraft affected when the false and deceptive instructions or clearances are no longer being transmitted.

15.5.1.4.2 Flight crews shall challenge or verify with the ATC unit concerned any instruction or clearance issued to them which they suspect may be false or deceptive.

15.5.1.4.3 When the transmission of false or deceptive instructions and clearances is detected, the appropriate authority shall take all necessary action to have the transmitter located and the transmission terminated.

15.6 OTHER ATC CONTINGENCY PROCEDURES

15.6.1 Emergency separation

15.6.1.1 If, during an emergency situation, it is not possible to ensure that the applicable horizontal separation can be maintained, emergency separation of half the applicable vertical separation minimum may be used, i.e. 150 m (500 ft) between aircraft in airspace where a vertical separation minimum of 300 m (1 000 ft) is applied, and 300 m (1 000 ft) between aircraft in airspace where a 600 m (2 000 ft) vertical separation minimum is applied.

15.6.1.2 When emergency separation is applied the flight crews concerned shall be advised that emergency separation is being applied and informed of the actual minimum used. Additionally, all flight crews concerned shall be provided with essential traffic

information.

15.6.2 Short-term conflict alert (STCA) procedures

Note 1.— The generation of short-term conflict alerts is a function based on surveillance data, integrated into an ATC system. The objective of the STCA function is to assist the controller in preventing collision between aircraft by generating, in a timely manner, an alert of a potential or actual infringement of separation minima.

Note 2. — In the STCA function the current and predicted three-dimensional positions of aircraft with pressure-altitude reporting capability are monitored for proximity. If the distance between the three-dimensional positions of two aircraft is predicted to be reduced to less than the defined applicable separation minima within a specified time period, an acoustic and/or visual alert will be generated to the controller within whose jurisdiction area the aircraft is operating.

15.6.2.1. Local instructions concerning use of the STCA function shall specify, inter alia:

- a. the types of flight which are eligible for generation of alerts;
- b. the sectors or areas of airspace within which the STCA function is implemented;
- c. the method of displaying the STCA to the controller;
- d. in general terms, the parameters for generation of alerts as well as alert warning time;
- e. the volumes of airspace within which STCA can be selectively inhibited and the conditions under which this will be permitted;
- f. conditions under which specific alerts may be inhibited for individual flights; and
- g. procedures applicable in respect of volume of airspace or flights for which STCA or specific alerts have been inhibited.

15.6.2.2. In the event an STCA is generated in respect of controlled flights, the controller shall without delay assess the situation and, if necessary, take action to ensure that the applicable separation minimum will not be infringed or will be restored.

15.6.2.3. Following the generation of an STCA, controllers should be required to complete an air traffic incident report only in the event that a separation minimum was infringed.

15.6.2.4. The appropriate ATS authority should retain electronic records of all alerts generated. The data and circumstances pertaining to each alert should be analysed to determine whether an alert was justified or not. Non-justified alerts, e.g. when visual separation was applied, should be ignored. A statistical analysis should be made of justified alerts in order to identify possible shortcomings in airspace design and ATC procedures as well as to monitor overall safety levels.

15.6.3 Procedures in regard to aircraft equipped with airborne collision avoidance systems (ACAS)

15.6.3.1 The procedures to be applied for the provision of air traffic services to aircraft equipped with ACAS shall be identical to those applicable to non-ACAS equipped aircraft. In particular, the prevention of collisions, the establishment of appropriate separation and the information which might be provided in relation to conflicting traffic and to possible avoiding action shall conform with the normal ATS procedures and shall exclude consideration of aircraft capabilities dependent on ACAS equipment.

15.6.3.2 When a pilot reports an ACAS resolution advisory (RA), the controller shall not attempt to modify the aircraft flight path until the pilot reports "Clear of Conflict".

15.6.3.3 Once an aircraft departs from its ATC clearance or instruction in compliance with an RA, or a pilot reports an RA, the controller ceases to be responsible for providing separation between that aircraft and any other aircraft affected as a direct consequence of the manoeuvre induced by the RA. The controller shall resume responsibility for providing separation for all the affected aircraft when:

- a. the controller acknowledges a report from the flight crew that the aircraft has resumed the current clearance; or
- b. the controller acknowledges a report from the flight crew that the aircraft is resuming

the current clearance and issues an alternative clearance which is acknowledged by the flight crew.

Note.—Pilots are required to report RAs which require a deviation from the current ATC clearance or instruction (see PANS-OPS (Doc 8168), Volume I, Part III, Section 3, Chapter 3, 3.2 c) 4)). This report informs the controller that a deviation from clearance or instruction is taking place in response to an ACAS RA.

15.6.3.4 Guidance on training of air traffic controllers in the application of ACAS events is contained in the *Airborne Collision Avoidance System (ACAS) Manual* (Doc9863).

15.6.3.5 ACAS can have a significant effect on ATC. Therefore, the performance of ACAS in the ATC environment should be monitored.

15.6.3.6 Following a significant ACAS event, pilots and controllers should complete an air traffic incident report.

Note 1.—The ACAS capability of an aircraft may not be known to air traffic controllers.

Note 2.—Operating procedures for use of ACAS are contained in PANS-OPS (Doc 8168), Volume I, Part III, Section 3, Chapter 3.

Note 3.—The phraseology to be used by controllers and pilots is contained in Chapter 12, 12.3.1.2.

15.6.4 Minimum safe altitude warning (MSAW) procedures

Note 1.—The generation of minimum safe altitude warnings is a function of an ATC radar data processing system. The objective of the MSAW function is to assist in the prevention of controlled flight into terrain accidents by generating, in a timely manner, a warning of the possible infringement of a minimum safe altitude.

Note 2.—In the MSAW function, the reported levels from aircraft with pressure-altitude reporting capability are monitored against defined minimum safe altitudes. When the level of an aircraft is detected or predicted to be less than the applicable minimum safe altitude, an acoustic and visual

warning will be generated to the controller within whose jurisdiction area the aircraft is operating.

15.6.4.1 Local instructions concerning use of the MSAW function shall specify, *inter alia*:

- a. the types of flight which are eligible for generation of MSAW;
- b. the sectors or areas of airspace for which MSAW minimum safe altitudes have been defined and within which the MSAW function is implemented;
- c. the values of the defined MSAW minimum safe altitudes;
- d. the method of displaying the MSAW to the controller;
- e. the parameters for generation of MSAW as well as warning time; and
- f. conditions under which the MSAW function may be inhibited for individual aircraft tracks as well as procedures applicable in respect of flights for which MSAW has been inhibited.

15.6.4.2 In the event an MSAW is generated in respect of a controlled flight, the following action shall be taken without delay:

- a. if the aircraft is being vectored, the aircraft shall be instructed to climb immediately to the applicable safe level and, if necessary to avoid terrain, be assigned a new heading;
- b. in other cases, the flight crew shall immediately be advised that a minimum safe altitude warning has been generated and be instructed to check the level of the aircraft.

15.6.4.3 Following an MSAW event, controllers should complete an air traffic incident report only in the event that a minimum safe altitude was unintentionally infringed with a potential for controlled flight into terrain by the aircraft concerned.

15.6.5 Autonomous runway incursion warning system (ARIWS)

Note 1.— The generation of ARIWS warnings is a function based on surveillance data. The objective of the ARIWS function is to assist flight crews and vehicle drivers in the prevention of runway incursions by generating, in a timely manner, a direct warning of a possible runway hazard making

it unsafe to enter, to cross a runway or to take-off

Note 2.— The function of ARIWS is to operate independently from ATC, and the warnings are generated for pilots and vehicle drivers.

Note 3.— Annex 14, Volume I, Attachment A, Section 21, provides a description of an autonomous runway incursion warning system (ARIWS) and information on its use.

15.6.5.1 In the event an ARIWS warning is generated that conflicts with the ATC clearance, the following action shall be taken by flight crew and vehicle drivers:

- a. the flight crew or vehicle driver shall give priority to the ARIWS warning over the ATC clearance. They shall not proceed onto the runway or commence the take-off roll. The flight crew or vehicle driver shall inform the controller of the ARIWS warning and await further clearance; and
- b. in the event the aircraft or vehicle has initiated actions to comply with a clearance that conflicts with the warning, the flight crew or the vehicle driver shall use the warning to exercise their best judgement and full authority in the choice of the best course of action to resolve any potential conflict. The controller should be informed, when practicable, of the ARIWS warning.

15.6.5.2 ATS units shall have procedures in place for situations when controllers are informed of ARIWS warnings, including how to disable the ARIWS in case of malfunctions.

15.6.6 Change of radiotelephony call sign for aircraft

15.6.6.1 An ATC unit may instruct an aircraft to change its type of RTF call sign, in the interests of safety, when similarity between two or more aircraft RTF call signs are such that confusion is likely to occur.

15.6.6.1.1 Any such change to the type of call sign shall be temporary and shall be applicable only within the airspace(s) where the confusion is likely to occur.

15.6.6.2 To avoid confusion, the ATC unit should, if appropriate, identify the aircraft which

will be instructed to change its call sign by referring to its position and/or level.

15.6.6.3 When an ATC unit changes the type of call sign of an aircraft, that unit shall ensure that the aircraft reverts to the call sign indicated by the flight plan when the aircraft is transferred to another ATC unit, except when the call sign change has been coordinated between the two ATC units concerned.

15.6.6.4 The appropriate ATC unit shall advise the aircraft concerned when it is to revert to the call sign indicated by the flight plan.

15.7 PROCEDURES FOR AN ATC UNIT WHEN A VOLCANIC ASH CLOUD IS REPORTED OR FORECAST

15.7.1 If a volcanic ash cloud is reported or forecast in the FIR for which the ACC is responsible, the controller should:

- a. relay all information available immediately to pilots whose aircraft could be affected to ensure that they are aware of the ash cloud's position and the flight levels affected;
- b. suggest appropriate re-routing to the flight crew to avoid an area of known or forecast ash clouds;
- c. inform pilots that volcanic ash clouds are not detected by relevant ATS surveillance systems;
- d. if the ACC has been advised by an aircraft that it has entered a volcanic ash cloud the controller should:
 - i. consider the aircraft to be in an emergency situation;
 - ii. not initiate any climb clearances to turbine-powered aircraft until the aircraft has exited the ash cloud; and
 - iii. not initiate vectoring without pilot concurrence.

Note.— Experience has shown that the recommended escape manoeuvre for an aircraft which has encountered an ash cloud is to reverse its course and begin a descent if terrain permits. The final responsibility for this decision, however, rests with the pilot.

15.7.2 Each State should develop appropriate procedures and contingency routings for avoidance of volcanic ash clouds that meet the circumstances of the State and fulfil its obligations to ensure safety of aircraft.

15.7.3 Controllers should be trained in procedures for avoidance of volcanic ash clouds and be made aware that turbine-engine aircraft encountering an ash cloud may suffer a complete loss of power. Controllers should take extreme caution to ensure that aircraft do not enter volcanic ash clouds.

Note 1.— There are no means to detect the density of a volcanic ash cloud or the size distribution of its particles and their subsequent impact on engine performance and the integrity of the aircraft.

Note 2.— Guidance material is provided in Chapters 4 and 5 of the Manual on Volcanic Ash, Radioactive Material and Toxic Chemical Clouds (Doc 9691).

15.8 ATS Contingency Plan

15.8.1 ANSP shall develop a contingency plan for each control airport that must describe in detail the actions that the operational staffs have to follow to maintain safety in the event of the failure or non-availability of facilities or equipment which affects the provision of air traffic services.

15.8.2 The plan must also cover procedures for the safe and orderly transition back to full service provision.

15.8.3 The plan so developed must include the contingency procedures that address the following things at minimum:

- a. Airspace and air-route management
- b. Air traffic services and necessary separation
- c. Transfer of responsibility and coordination procedure
- d. Staff training requirements to ensure the plan can be safely implemented

CHAPTER 16

MISCELLANEOUS PROCEDURES

16.1 RESPONSIBILITY IN REGARD TO MILITARY TRAFFIC

16.1.1 It is recognized that some military aeronautical operations necessitate non-compliance with certain air traffic procedures. In order to ensure the safety of flight operations the appropriate military authorities shall be asked, whenever practicable, to notify the proper air traffic control unit prior to undertaking such manoeuvres.

16.1.2 A reduction of separation minima required by military necessity or other extraordinary circumstances shall only be accepted by an air traffic control unit when a specific request in some recorded form has been obtained from the authority having jurisdiction over the aircraft concerned and the lower minima then to be observed shall apply only between those aircraft. Some recorded form of instruction fully covering this reduction of separation minima must be issued by the air traffic control unit concerned.

16.1.3 Temporary airspace reservation, either stationary or mobile, may be established for the use of large formation flights or other military air operations. Arrangements for the reservation of such airspaces well as safe access by other airspace user to such reserve airspace shall be accomplished by coordination between the user and ANSP. Additionally the coordination of other activities potentially hazardous to civil aircraft shall be effected in accordance with the provisions of CAR 11 and completed early enough to permit timely promulgation of information in accordance with the provisions of CAR 15.

16.2 RESPONSIBILITY IN REGARD TO UNMANNED FREE BALLOONS

16.2.1 On receipt of notification of the intended flight of a medium or heavy unmanned free balloon, the air traffic services unit shall arrange for the information to be disseminated to all concerned. The information shall include:

- a. the balloon flight identification or project code name;
- b. balloon classification and description;

- c. SSR code or NDB frequency as applicable;
- d. the launch site;
- e. the estimated time of the commencement of the launch or the planned period of the launches;
- f. the expected direction of ascent;
- g. the cruising level(s) (pressure-altitude); and
- h. the estimated elapsed time to pass 18 000 m (60 000 ft) pressure-altitude, or to reach cruising level if at or below 18 000 m (60 000 ft), together with the estimated location.

16.2.2 On receipt of notification that a medium or heavy unmanned free balloon has been launched, the air traffic services unit shall arrange for the information to be disseminated to all concerned. The information shall include:

- a. the balloon flight identification or project code name;
- b. balloon classification and description;
- c. SSR code or NDB frequency as applicable;
- d. the launch site;
- e. the time of launch(es);
- f. the estimated time at which 18 000 m (60 000 ft) pressure-altitude will be passed, or the estimated time at which the cruising level will be reached if at or below 18000 m (60000 ft), and the estimated location;
- g. the estimated date and time of termination of the flight; and
- h. the planned location of ground contact, when applicable.

16.2.3 When there is reasonable expectation that a heavy or medium unmanned free balloon will cross

international borders, the appropriate ATS unit shall arrange for the pre-launch and the launch notifications to be sent by NOTAM to the ATS unit(s) in the State(s) concerned. If agreed between the States concerned, the launch notification may be transmitted orally by direct ATS speech circuit between the ACCs/flight information centres involved.

- 16.2.4** Air traffic services units shall maintain radar and/or ADS-B surveillance of medium and heavy unmanned free balloons to the extent possible and, if necessary and on the request of the pilot of an aircraft, provide separation using an ATS surveillance system between the aircraft and such balloons which are identified or their exact position is known.

16.3 AIR TRAFFIC INCIDENT REPORT

- 16.3.1** An air traffic incident report shall be submitted, normally to the air traffic services unit concerned, for incidents specifically related to the provision of air traffic services involving such occurrences as aircraft proximity (AIRPROX), or other serious difficulty resulting in a hazard to aircraft, caused by, among others, faulty procedures, non-compliance with procedures, or failure of ground facilities.

- 16.3.2** Procedures should be established for the reporting of aircraft proximity incidents and their investigation to promote the safety of aircraft. The degree of risk involved in an aircraft proximity should be determined in the incident investigation and classified as “risk of collision”, “safety not assured”, “no risk of collision” or “risk not determined”.

Note.— A model air traffic incident report form together with instructions for its completion is at Appendix 4. Further information regarding air traffic incidents is contained in the Air Traffic Services Planning Manual (Doc 9426).

- 16.3.3 Aircraft accidents and incidents are often reported through ATS channels. Such report and any associated Information shall be recorded by the unit concern and forwarded to Civil Aviation Safety Regulation Directorate.**

Note.— A model air traffic incident report form together with instructions for its completion is at Appendix 4. Further information regarding air traffic incidents is contained in the Air Traffic Services Planning Manual (Doc 9426)

16.3.4 An air traffic service incident report shall be submitted by the air traffic services unit concerned, for incidents specifically related to the provision of air traffic services involving such occurrences as aircraft accident, proximity (AIRPROX), incident, violation, and infringement or other serious difficulty resulting in a hazard to aircraft, caused by, among others, faulty procedures, non-compliance with procedures, or failure of ground facilities.

Note.— A model air traffic service incident report form is at Appendix 5.

16.3.5 A bird/other wildlife strike report shall be submitted by Air Traffic Services Unit Concerned for incidents specifically related to the provision of air traffic service involving such occurrences as aircraft accident, incident, hazard, bird strike, wildlife strike or other serious difficulty resulting in a hazard to aircraft, caused by bird or other wildlife.

Note.— A model of A bird/other wildlife strike report form is at Appendix 6.

16.4 USE OF REPETITIVE FLIGHT PLANS(RPLS)

16.4.1 General

16.4.1.1 RPLs shall not be used for flights other than IFR flights operated regularly on the same day(s) of consecutive weeks and on at least ten occasions or every day over a period of at least ten consecutive days. The elements of each flight plan shall have a high degree of stability.

Note.— For permissible incidental changes to RPL data affecting the operation for one particular day, and not intended to be a modification of the listed RPL, see 16.4.4.2.2 and 16.4.4.2.3.

16.4.1.2 RPLs shall cover the entire flight from the departure aerodrome to the destination aerodrome. RPL procedures shall be applied only when all ATS authorities concerned with the flights have agreed to accept RPLs.

16.4.1.3 The use of RPLs for international flight shall be subject to the provision that the affected adjacent States either already use RPLs or will use them at the same time.

16.4.2 Procedures for submission of RPLs by operators

16.4.2.1 Conditions governing submission, notification of changes, or cancellation of RPLs shall be the subject of appropriate arrangements between operators and ANSP.

16.4.2.2 An RPL shall comprise information regarding such of the following items as are considered relevant by the ANSP:

- a. validity period of the flight plan
- b. days of operation
- c. aircraft identification
- d. aircraft type and wake turbulence category
- e. MLS capability
- f. departure aerodrome
- g. off-block time
- h. cruising speed(s)
- i. cruising level(s)
- j. route to be followed
- k. destination aerodrome
- l. total estimated elapsed time
- m. indication of the location where the following information may be obtained immediately upon request:
 - i. alternate aerodromes
 - ii. fuel endurance
 - iii. total number of persons on board

- iv. emergency equipment
- n. other information.

16.4.3 Submission of total listings

16.4.3.1 RPLs shall be submitted in the form of listings containing the required flight plan data using an RPL listing form specially designed for the purpose or by means of other media suitable for electronic data processing.

Note.— A model RPL listing form is contained in Appendix 2.

16.4.3.2 Initial submission of complete RPL listings and any subsequent seasonal resubmission of complete listings shall be made in sufficient time to permit the data to be properly assimilated by the ATS organization. The minimum lead time required for the submission of such listings shall be established by the administrations concerned and published in their AIPs. This minimum lead time shall be at least two weeks.

16.4.3.3 Operators shall submit listings to the designated agency for distribution to the appropriate air traffic services units.

16.4.3.4 The information normally to be provided shall be that listed in 16.4.2.2 except that administrations may also require the provision of estimate information of FIR boundaries and the primary alternate aerodrome. If so required, such information shall be provided as indicated on an RPL listing form specially designed for the purpose.

16.4.3.5 Information regarding alternate aerodrome(s) and supplementary flight plan data (information normally provided under Item 19 of the ICAO flight plan form) shall be kept readily available by the operator at the departure aerodrome or another agreed location, so that, on request by ATS units, it can be supplied without delay. The name of the office from which the information can be obtained shall be recorded on the RPL listing form.

16.4.3.6 Acknowledgement of receipt of listings of flight plan data and/or amendment thereto shall not be required except by agreement between operators and the appropriate agency

16.4.4 Changes to RPL listings

16.4.4.1 CHANGES OF A PERMANENT NATURE

16.4.4.1.1 Changes of a permanent nature involving the inclusion of new flights and the deletion or modification of currently listed flights shall be submitted in the form of amendment listings. These listings shall reach the air traffic services agency concerned at least seven days prior to the change becoming effective.

16.4.4.1.2 Where RPL listings have been initially submitted by the use of media suitable for electronic data processing, it shall be permissible by mutual agreement between the operator and the appropriate authority for some changes to be submitted by means of RPL listing forms.

16.4.4.1.3 All RPL changes shall be submitted in accordance with the instructions for preparation of RPL listings.

16.4.4.2 CHANGES OF A TEMPORARY NATURE

16.4.4.2.1 Changes of a temporary, non-recurring nature relating to RPLs concerning aircraft type and wake turbulence category, speed and/or cruising level shall be notified for each individual flight as early as possible and not later than 30 minutes before departure to the ATS reporting office responsible for the departure aerodrome. A change of cruising level only may be notified by radiotelephony on initial contact with the ATS unit.

16.4.4.2.2 In case of an incidental change in the aircraft identification, the departure aerodrome, the route and/or the destination aerodrome, the RPL shall be cancelled for the day concerned and an individual flight plan shall be submitted.

16.4.4.2.3 Whenever it is expected by the operator that a specific flight, for which an RPL has been submitted, is likely to encounter a delay of 30 minutes or more in excess of the off-block time stated in that flight plan, the ATS unit responsible for the departure aerodrome shall be notified immediately.

Note.— Because of the stringent requirements of flow control, failure by operators to comply

with this procedure may result in the automatic cancellation of the RPL for that specific flight at one or more of the ATS units concerned.

16.4.4.2.4 Whenever it is known to the operator that any flight for which an RPL has been submitted is cancelled, the ATS unit responsible for the departure aerodrome shall be notified.

16.4.4.3 OPERATOR/PILOT LIAISON

The operator shall ensure that the latest flight plan information, including permanent and incidental changes, pertaining to a particular flight and duly notified to the appropriate agency, is made available to the pilot-in-command.

16.4.4.4 RPL PROCEDURES FOR ATS UNITS

The procedures for handling RPLs described herein are applicable regardless of whether automatic data-processing equipment is utilized or flight plan data is handled manually.

16.4.4.5 IMPLEMENTATION OF RPL PROCEDURES

16.4.4.5.1 Procedures for use of RPLs may be established for flights operating within a single FIR or a single State.

16.4.4.5.2 Procedures may also be established for flights across international boundaries subject to the provision that affected States currently utilize or will concurrently use RPLs.

16.4.4.5.3 Application of RPL procedures for international flights requires the establishment of bilateral or multilateral agreements between the ANSPs concerned.

16.4.4.5.4 Application of RPLs requires agreements with participating operators to establish submission and amendment procedures.

16.4.4.5.5 Agreements shall include provisions for the following procedures:

- a. initial submission;
- b. permanent changes;

- c. temporary and incidental changes;
- d. cancellations;
- e. additions; and
- f. completely revised listings when indicated by extensive changes.

16.4.4.6 COLLECTION, STORAGE AND PROCESSING OF RPL DATA

16.4.4.6.1 ANSP using RPLs shall designate one or more agencies responsible for administering such data. The area of responsibility for any such designated agency shall be at least one FIR.. Each designated agency shall distribute relevant RPL data to the ATS units concerned within its area of responsibility so that such data reach these units in sufficient time to become effective.

16.4.4.6.2 RPLs shall be stored by each ATS unit concerned in a manner that will ensure that they are systematically activated on the appropriate day of operation in the order of estimated times indicative of entry into the unit's area of responsibility. Activation shall be accomplished in sufficient time to present the data to the controller in appropriate form for analysis and control action.

16.4.4.7 SUSPENSION OF RPL PROCEDURES

ANSP obliged, due to exceptional circumstances, to temporarily suspend the use of RPLs in its area of responsibility, or a specified part thereof, shall publish notice of such suspension with as much advance notice as possible and in the most suitable form considering the circumstances.

16.4.4.8 ATS MESSAGES RELATED TO INDIVIDUAL FLIGHTS OPERATING ON AN RPL

ATS messages relating to individual flights operating on an RPL shall be originated and addressed to ATS units concerned in a manner identical to that used for flights operating on individual flight plans.

16.5 STRATEGIC LATERAL OFFSET PROCEDURES (SLOP)

Note 1.— SLOP are approved procedures that allow aircraft to fly on a parallel track to the right of the centre line relative to the direction of flight to mitigate the lateral overlap probability due to increased navigation accuracy and wake turbulence encounters. Unless specified in the separation standard, an aircraft's use of these procedures does not affect the application of prescribed separation standards.

Note 2.— Annex 2, 3.6.2.1.1, requires authorization for the application of strategic lateral offsets from the appropriate ATS authority responsible for the airspace concerned.

16.5.1 Implementation of strategic lateral offset procedures shall be coordinated among the States involved.

Note.— Information concerning the implementation of strategic lateral offset procedures is contained in the Implementation of Strategic Lateral Offset Procedures (Circular 354).

16.5.2 Strategic lateral offsets shall be authorized only in en-route airspace as follows:

- a. where the lateral separation minima or spacing between route centre lines is 28 km (15 NM) or more, offsets to the right of the centre line relative to the direction of flight in tenths of a nautical mile up to a maximum of 3.7 km (2 NM); and
- b. where the lateral separation minima or spacing between route centre lines is 19 km (10 NM) or more and less than 28 km (15 NM), while one aircraft climbs/descends through the level of another aircraft, offsets to the right of the centre line relative to the direction of flight in tenths of a nautical mile up to a maximum of 3.7 km (2 NM); and
- c. where the lateral separation minima or spacing between route centre lines is 11.1 km (6 NM) or more and less than 28 km (15 NM), offsets to the right of the centre line relative to the direction of flight in tenths of a nautical mile up to a maximum of 0.9 km (0.5 NM).

Note.— Refer to 5.4.1.2.1.6 for lateral separation of aircraft on parallel or non-intersecting tracks or ATS routes.

16.5.3 The routes or airspace where application of strategic lateral offsets is authorized, and the procedures to be followed by pilots, shall be promulgated in aeronautical information

publications (AIPs). In some instances, it may be necessary to impose restrictions on the use of strategic lateral offsets, e.g. where their application may be inappropriate for reasons related to obstacle clearance. Route conformance monitoring systems shall account for the application of SLOP.

16.5.4 The decision to apply a strategic lateral offset shall be the responsibility of the flight crew. The flight crew shall only apply strategic lateral offsets in airspace where such offsets have been authorized by the appropriate ATS authority and when the aircraft is equipped with automatic offset tracking capability.

Note 1.— Pilots may contact other aircraft on the inter-pilot air-to-air frequency 123.45 MHz to coordinate offsets.

Note 2.— The strategic lateral offset procedure has been designed to include offsets to mitigate the effects of wake turbulence of preceding aircraft. If wake turbulence needs to be avoided, an offset to the right and within the limits specified in 16.5.2 may be used.

Note 3.— Pilots are not required to inform ATC that a strategic lateral offset is being applied.

16.6 NOTIFICATION OF SUSPECTED COMMUNICABLE DISEASES, OR OTHER PUBLIC HEALTH RISK, ON BOARD AN AIRCRAFT

16.6.1 The flight crew of an en-route aircraft shall, upon identifying a suspected case(s) of communicable disease, or other public health risk, on board the aircraft, promptly notify the ATS unit with which the pilot is communicating, the information listed below:

- a. aircraft identification;
- b. departure aerodrome;
- c. destination aerodrome;
- d. estimated time of arrival;
- e. number of persons on board;

- f. number of suspected case(s) on board; and
- g. nature of the public health risk, if known.

16.6.2 The ATS unit, upon receipt of information from a pilot regarding suspected case(s) of communicable disease, or other public health risk, on board the aircraft, shall forward a message as soon as possible to the ATS unit serving the destination/departure, unless procedures exist to notify the appropriate authority designated by the State and the aircraft operator or its designated representative.

16.6.3 When a report of a suspected case(s) of communicable disease, or other public health risk, on board an aircraft is received by an ATS unit serving the destination/departure, from another ATS unit or from an aircraft or an aircraft operator, the unit concerned shall forward a message as soon as possible to the public health authority (PHA) or the appropriate authority designated by the State as well as the aircraft operator or its designated representative, and the aerodrome authority.

Note 1.— See Annex 9 — Facilitation, Chapter 1 (Definitions), Chapter 8, 8.12 and 8.15, and Appendix 1, for relevant additional information related to the subject of communicable disease and public health risk on board an aircraft.

Note 2.— The PHA is expected to contact the airline representative or operating agency and aerodrome authority, if applicable, for subsequent coordination with the aircraft concerning clinical details and aerodrome preparation. Depending on the communications facilities available to the airline representative or operating agency, it may not be possible to communicate with the aircraft until it is closer to its destination. Apart from the initial notification to the ATS unit whilst en-route, ATC communications channels are to be avoided.

Note 3.— The information to be provided to the departure aerodrome will prevent the potential spread of communicable disease, or other public health risk, through other aircraft departing from the same aerodrome.

Note 4.— AFTN (urgency message), telephone, facsimile or other means of transmission may be used.

16.7 Documents and Records

16.7.1 DOCUMENTS

16.7.1.1 A document control system covers the authorization, standardization, publication, distribution and amendment of all documentation issued by the organisation, or required by the organisation for the provision of air traffic services.

16.7.1.2 These processes must ensure:

- a. authorization is by a designated authority appropriate to the management and safety accountability structures;
- b. currency can be readily determined;
- c. availability at locations where needed by ATSO personnel;
- d. only current versions are available;
- e. a master copy is securely held;
- f. archival where superseded.

16.7.1.3 Reference Materials. For the purposes of sub-regulations, the manuals and documents to be maintained are the following:

- a. manuals for equipment used by staff in the provision of air traffic services;
- b. the relevant sections of the Aerodrome Emergency Plan (aerodrome services only).

16.7.2 RECORDS

16.7.2.1 A system for records covers identification, collection, indexing, storage, security, maintenance, access and disposal of records necessary for the provision of air traffic services.

16.7.2.2 Records systems must provide an accurate chronicle of ATS activities for the purpose of reconstruction of events for air safety investigation, and for system safety analysis.

16.7.3 RECORDS TO BE KEPT

16.7.3.1 **Automatic recordings.** The following items used for the provision of air traffic services must be recorded automatically and retained at least for the period shown below:

- a. direct pilot-controller two-way radiotelephony or datalink communications—30 days;
- b. direct-speech or data link between airtraffic services units —30 days;
- c. surveillance data from primary and secondary radar equipment —30 days;
- d. automated flight data processing including on-screen display of aircraft tracks and label blocks —30 days.

16.7.3.2 **Time injection.** Automatic recordings must have a means of establishing accurately the time, in hours/minutes/seconds, at which any recorded event occurred.

16.7.3.3 **Document records.** The following items must be kept for a minimum of 90 days:

- a. ATS messages, including flight plans;
- b. flight progress strips or documents of a similar nature used for the recording of flight data and the issue of clearances, instructions and directions;
- c. log books;

16.7.3.4 **Personnel Licensing Records.** Records of ATS personnel licensing and competency certification and rating under ATS Operation Manual must be kept for a minimum of 5 years, including after an employee ceases to be employed by the ATS provider. This includes details of:

- a. training;
- b. renewal and currency of ratings, endorsements and qualifications; and
- c. other proficiencies required by the ATS provider to be demonstrated.

- 16.7.3.5 **Record retention for investigation.** Where requisitioned, by an appropriate authority, for the purposes of investigation, records must be isolated and kept in a secure place until their release by that authority.

16.7.4 MAINTAINING OPERATIONAL LOG BOOKS

- 16.7.4.1 The Log Book must be used to record all significant occurrences and actions relating to operations, facilities, equipment and staff at an ATS unit.

[Note: Except when forms such as fault reports or Air Safety Incident Reports must also be completed, duplication of information should be avoided.]

- 16.7.4.2 A working record or Log Book entry must not be inserted between earlier entries. In the event of an out of sequence entry being necessary, it must be entered as soon as possible, and annotated that it is out of sequence with an explanatory note as to why it is out of sequence.

- 16.7.4.3 All Log Book entries must be recorded against the times of the occurrence, or time of the Log Book entry.

- 16.7.4.4 Minimum information to be recorded. The minimum information to be recorded is shown in the following table.

| <i>Occasion</i> | <i>Information</i> |
|--|--|
| At the commencement of each day's operation | <ul style="list-style-type: none"> • UTC date and time; • Where required, identification of the unit and/or the operating position. |
| On assuming responsibility for a position | <ul style="list-style-type: none"> • The UTC date and time of assuming responsibility for a position and the signature of the officer commencing duty (see also voice recordings); • Results of equipment checks; • Result of time check. |
| During operation of the unit | <ul style="list-style-type: none"> • Air Safety Incidents, including accidents and breaches of the Regulations such as noncompliance with ATC instructions; [Note: This is in addition to the completion of incident reporting actions.] • Actions taken in relation to any SAR activity including distress communications; • General notes concerning essential aerodrome information, such as the results of aerodrome inspections, closure of sections of the manoeuvring area caused by works or natural phenomena, etc.; • Times of aerodrome closure and reopening, with reasons for the closure; • Change in status of facilities, service or procedure including communication difficulties and tests; • Short term changes in staffing or hours of coverage, including variations to required staffing levels; • Any dispensation given against the Regulations Status of navigation aids. |
| Handover/takeover (where a separate form is not provided and kept as a record) | <ul style="list-style-type: none"> • A resume of outstanding action and unusual operations which are current or anticipated, relating to the traffic display and/or SAR activity; • The status of communications and equipment; • The time of handover/takeover, against the signatures of the officers involved |
| Closure of unit and/or Position | <ul style="list-style-type: none"> • Time of closure and conditions and actions relating to the closure, followed by changes to equipment status, and any outstanding action; • The time of intended reopening, and the signature of the officer closing the unit/position. |

16.7.5 VOICE AND DATA RECORDING

16.7.5.1 When an automatic voice recording facility fails, a manual record of communications must be maintained, to the possible extent.

16.8 ATS FACILITIES AND EQUIPMENT

16.8.1 INTRODUCTION

16.8.1.1 This standard sets out the standards for the design, siting, construction, equipping and maintenance of ATC facilities where applicable. Further information is contained in an Advisory Circular.

16.8.2 CONTROL TOWERS

16.8.2.1 A control tower first commissioned after 1 January 2013, must enable the controller to have:

- a. adequate vision to all the manoeuvring area and airspace which are under the controllers' area of responsibility;
- b. a view of all runway ends and taxiways,
- c. maximum vision of airborne traffic patterns with primary consideration given to the view from the aerodrome control position(s);
- d. unobstructed line of sight from the control tower eye level to the manoeuvring area of the aerodrome;
- e. sufficient visual resolution of all aerodrome movement areas for which he/she has a responsibility;

16.8.2.2 In addition, procedures or facilities are required to ensure:

- a. protection from glare, reflection and noise;
- b. unobstructed view from an existing control tower cab.

16.8.2.3 Communication. Each control tower must contain:

- a. an appropriate power supply to service the facilities identified in this Section;
- b. facilities capable of two-way communications with aircraft, vehicles and persons within its area of responsibility;
- c. facilities capable of providing two-way communications:
 - i. between operational positions within the control tower;
 - ii. with adjacent ATS units;
 - iii. with aerodrome rescue and firefighting services;
- d. a means of alerting emergency services;
- e. a means of recording air/ground/air and ground/ground communications;
- f. AFTN terminal or other means to provide information normally conveyed by AFTN;
- g. binoculars;
- h. signal lamp, with white, red and green functions.

16.8.2.4 Displays. A control tower must have the following displays:

- a. flight data displays (e.g. flight progress boards);
- b. meteorological displays which meet the accuracy criteria specified in Annex 3 and which provide at least the following information:
 - i. wind velocity;
 - ii. barometric pressure;
 - iii. temperature.

Note: The meteorological displays must show mean speed and mean direction of the

surface wind. Surface wind observations are to be representative of the conditions along the runway and near the touchdown zones. If more than one sensor is used, the displays must identify the sensor being utilized for the observation.

- c. operational data displays for:
 - i. other significant weather information;
 - ii. NOTAMS;
 - iii. handover/takeover;
 - iv. essential aerodrome information;
 - v. relevant maps and charts;
- d. a time display at each operational position.
- e. a means to readily recognize the failure of any terrestrial navigation aid concerned.

16.8.2.5 Switching, monitors and controls for aerodrome equipment. A control tower must have appropriate switching, monitors, and controls for aerodrome lighting equipment for which the control tower has responsibility, including:

- a. runway lighting;
- b. approach lighting;
- c. high intensity approach and runway lighting;
- d. taxiway lighting;
- e. VASIS;
- f. obstruction lighting;
- g. illuminated wind indicator; and

h. aerodrome beacon.

16.8.2.6 A control tower must have a means to readily recognize the failure of any terrestrial navigation aid being used for ATS purposes.

16.8.3 AREA CONTROL CENTRE AND APPROACH CONTROL UNIT

16.8.2.7 Area Control Centre and Approach Control Unit must incorporate the following facilities:

- a. air/ground RTF and/or data link communications equipment on assigned frequencies, in accordance with CAR-11 Air Traffic Services, Chapter 6;
- b. ground/ground voice and/or data link equipment to enable communication between adjacent air traffic service units including control towers and the area control centre or approach control unit, in accordance with CAR-11 Air Traffic Services, Chapter 6;
- c. time display at each operational position;
- d. flight data display;
- e. operational data display;
- f. appropriate maps and charts;
- g. external communications;
- h. a means to readily recognize the failure of any terrestrial navigation aid used in providing separation to aircraft;
- i. voice and, where applicable, data recording equipment;
- j. AFTN terminal or other means to provide information normally conveyed by AFTN.

16.8.2.8 Area control centres and approach control units must have a means to readily recognise the failure of any terrestrial navigation aid being used for the control of aircraft.

16.8.4 COMMISSIONING OF NEW FACILITIES AND EQUIPMENT

16.8.2.9 Any new facilities must be commissioned in accordance with procedures stated in the concerned ATS Operations Manual.

16.8.2.10 The procedures must describe the way to determine:

- a. the functional and performance requirements for the facility to be met; and
- b. all ATS operating procedures to be validated; and
- c. sufficient trained ATS personnel are available to operate the facility; and
- d. all supportive arrangements for the facilities, including any necessary agreements, are in place.

16.9 SECTOR VISIBILITY PROCEDURES

Sector visibility procedures, if required, may be established by the ATS provider of concerned airports after getting appropriate approval by incorporating in the ATS Operational Manual.

16.10 PROVISIONS OF MAPS AND CHARTS

Maps and charts shall be prepared and published by ANSP in the respective SOPs of the concerned airports as per the Standards as mentioned in CAR-4 (Aeronautical Charts).

16.11 PROVISIONS FOR AIRPORT OPERATION

16.11.1 The Air Traffic Service to be provided in Nepal shall be as per the standards specified in the Civil Aviation Requirements issued by the Authority.

16.11.2 The responsibility of ensuring the service as per the standard pursuant to 16.9.1 shall be that of the **chief of the concerned airport**.

16.11.3 All pilots, during flight, should follow the instruction of the Air Traffic Controller.

16.11.4 If any situation arises for not being able to comply with the instruction given by the Air Traffic

Controller pursuant to 16.9.3 in a view of the flight safety, the pilot shall inform the same to the Air Traffic Controller.

16.11.5 Any information on incident, event or occurrence relating to the air navigation services that affects or may affect the safety of air navigation should be reported to Civil Aviation Safety Regulation Directorate without any delay.

16.11.6 The **chief of the concerned airport** shall have the responsibility to install, operate and maintain the communication, navigation and surveillance equipment to support smooth operation of Air Traffic Services.

16.12 PROCEDURE FOR TAKING OVER AND HANDLING OVER WATCH

16.12.1 PRIOR TO TAKING OVER (AND HANDLING OVER) WATCH CELL PHONE SHALL BE KEPT IN MANNER MODE

16.12.1.1 TAKING OVER WATCH

16.12.1.2 Prior to taking over watch ATCOs shall:

Ensure that they are fully conversant with the latest promulgated orders, instructions, notices and signals with particular reference where appropriate to the serviceability of the aerodrome and its facilities.

16.12.1.3 Obtain full information and briefing from the MET office regarding the weather position and tendencies for the period of their watch whenever necessary as justified by the general weather condition.

16.12.1.4 Ensure that they have a full understanding of the air traffic situation prevailing with particular reference to separation standards.

16.12.1.5 Familiarise themselves with the serviceability of all equipment under their charge and likely to be used during the period of their watch.

16.12.1.6 Ensure that they are acquainted with any special movements or maneuvers likely to occur during their watch.

16.12.1.7 At station where more than one ATCO are employed at one time on ATS units, the ATC watch log shall be signed by the watch supervisor or SATCO on duty. Other ATCOs shall record taking over their specific duties as required. To accommodate all the above work ATCOs shall report to their respective ATS Units at least 10 minutes ahead of relieving the shift.

16.12.2 HANDLING OVER WATCH

16.12.2.1 ATCOs handling over watch shall ensure that they provide their successors with the complete possible information regarding the current situation including any items of specific interest or urgency which have influenced the development of the situation and which may have a bearing on the progress of the ensuring or upcoming or following watch.

16.12.2.2 Should any situation have developed during the watch such as action in the event of distress, emergency or accident whereby in the interests of safety or efficiency it is considered beneficial for the Duty ATCO to complete such actions and subsequent reports and records rather than to transfer the responsibility for completion to another officer. Notwithstanding the fact that watch roster defines the appointed time to hand over, the ATCO handling over watch shall remain on until such time as this responsibility has been discharged.

16.13 CONTROL ROOM DISCIPLINE

16.13.1 VISITORS

No unauthorized person shall be granted access to an ATS Operational Room. Allowing such visitors to the Control Room is the explicit authority of the watch supervisor and before bringing in authorized visitors a check shall be made with the watch supervisor or the Duty ATCO as to whether the traffic situation permits such a visit. At no time shall visitors be allowed to interfere with the smooth running of the watch and cell phone shall be kept in manner mode.

16.13.2 CLEANLINESS

The watch supervisor or the Duty ATCO depending on the ATS unit, shall ensure that the ATS Unit Room is kept in a clean and tidy condition at all times and all equipments shall be kept in

serviceable condition and stowed away when not in use.

16.13.3 SUPERVISION

The watch supervisor or the ATCO-in-charge, depending on the ATS Unit shall be responsible for the supervision of all staffs and the maintaining good condition.

16.13.4 DUTY ROSTER

16.13.4.1 A watch keeping roster shall be prepared by the ATC-in-Charge of the concerned ATC unit not later than the 20th day of each month and shall show the hours of watch-keeping and hours of duty required of individuals ATCO throughout the following month.

16.13.4.2 ATCOs shall adhere to the time and periods of watch-keeping duties details in this roster and shall arrive at their work place in time to carry out the procedures detailed in para 16.12 (procedure for taking over handling over watch)

16.13.4.3 Duty Roster shall be displayed at the ATS units.

16.14 DISSEMINATION OF SAFETY CRITICAL ELEMENTS

ATS provider shall disseminate all safety-critical information, such as NOTAM, directives, circulars, maps and charts and ATS related publications to all ATS unit for safe ATS operational environment.

Appendix 1

INSTRUCTIONS FOR AIR-REPORTING BY VOICE COMMUNICATIONS

1. Reporting instructions
2. Special air-report of volcanic activity form (Model VAR)
3. Examples

1. Reporting instructions

MODEL AIREP SPECIAL

| ITEM | PARAMETER | TRANSMIT IN TELEPHONY as appropriate |
|------|--|--------------------------------------|
| — | Message-type designator: • special air-report | [AIREP] SPECIAL |

| | | | |
|-----------|---|---------------------------------------|--|
| Section 1 | 1 | Aircraft identification | <i>(aircraft identification)</i> |
| | 2 | Position | POSITION <i>(latitude and longitude)</i> OVER <i>(significant point)</i> ABEAM <i>(significant point)</i> <i>(significant point) (bearing) (distance)</i> |
| | 3 | Time | <i>(time)</i> |
| | 4 | Level | FLIGHT LEVEL <i>(number)</i> or <i>(number)</i> METRES or FEET CLIMBING TO FLIGHT LEVEL <i>(number)</i> or <i>(number)</i> METRES or FEET DESCENDING TO FLIGHT LEVEL <i>(number)</i> or <i>(number)</i> METRES or FEET |
| | 5 | Next position and estimated time over | <i>(position) (time)</i> |
| | 6 | Ensuing significant point | <i>(position)</i> NEXT |
| Section 2 | 7 | Estimated time of arrival | <i>(aerodrome) (time)</i> |
| | 8 | Endurance | ENDURANCE <i>(hours and minutes)</i> |

| | | | |
|-----------|---|---|--|
| Section 3 | 9 | Phenomenon encountered or observed, prompting a special air-report: | |
| | | • Moderate turbulence | TURBULENCE MODERATE |
| | | • Severe turbulence | TURBULENCE SEVERE |
| | | • Moderate icing | ICING MODERATE |
| | | • Severe icing | ICING SEVERE |
| | | • Severe mountainwave | MOUNTAINWAVE SEVERE |
| | | • Thunderstorms without hail | THUNDERSTORMS |
| | | • Thunderstorms with hail | THUNDERSTORMS WITH HAIL |
| | | • Heavy dust/sandstorm | DUSTSTORM or SANDSTORM HEAVY |
| | | • Volcanic ash cloud | VOLCANIC ASH CLOUD |
| | | • Pre-eruption volcanic activity or volcanic eruption | PRE-ERUPTION VOLCANIC ACTIVITY <i>or</i> VOLCANIC ERUPTION |

1. Position reports and special air-reports

1.1 Section 1 is obligatory for position reports and special air-reports, although Items 5 and 6 thereof may be omitted when prescribed in *Regional Supplementary Procedures*; Section 2 shall be added, in whole or in part, only when so requested by the operator or its designated representative, or when deemed necessary by the pilot-in-command; Section 3 shall be included in special air-reports.

1.2 Special air-reports shall be made whenever any of the phenomena listed under Item 15 are observed or encountered. Items 1 to 4 of Section 1 and the appropriate phenomenon specified in Section 3, Item 15, are required from all aircraft. The phenomena listed under “SST” shall be reported only by supersonic transport at transonic and supersonic cruising levels.

1.3 In the case of special air-reports containing information on volcanic activity, a post-flight

report shall be made on the volcanic activity reporting form (Model VAR). All elements which are observed shall be recorded and indicated respectively in the appropriate places on the form Model VAR.

- 1.4 Special air-reports shall be made as soon as practicable after a phenomenon calling for a special air-report has been observed.
- 1.5 If a phenomenon warranting the making of a special air-report is observed at or near the time or place where a routine air-report is to be made, a special air-report shall be made instead.

2. Detailed reporting instructions

- 2.1 Items of an air-report shall be reported in the order in which they are listed in the model AIREP SPECIAL form. — MESSAGE TYPE DESIGNATOR. Report “SPECIAL” for a special air-report.

Section 1

Item 1 — AIRCRAFT IDENTIFICATION. Report the aircraft radiotelephony call sign as prescribed in Annex 10, Volume II, Chapter 5.

Item 2 — POSITION. Report position in latitude (degrees as 2 numerics or degrees and minutes as 4 numerics, followed by “North” or “South”) and longitude (degrees as 3 numerics or degrees and minutes as 5 numerics, followed by “East” or “West”), or as a significant point identified by a coded designator (2 to 5 characters), or as a significant point followed by magnetic bearing (3 numerics) and distance in nautical miles from the point (e.g. “4620North07805West”, “4620North07800West”, “4600North07800West”, LN (“LIMA NOVEMBER”), “MAY”, “HADDY” or “DUB 180 DEGREES 40 MILES”). Precede significant point by “ABEAM”, if applicable.

Item 3 — TIME. Report time in hours and minutes UTC (4 numerics) unless reporting time in minutes past the hour (2 numerics) is prescribed on the basis of regional air navigation agreements. The time reported must be the actual time of the aircraft at the position and not the time of origination or transmission of the report. Time shall always be reported in hours and

minutes UTC when making a special air-report.

Item 4 — FLIGHT LEVEL OR ALTITUDE. Report flight level by 3 numerics (e.g. “FLIGHT LEVEL 310”), when on standard pressure altimeter setting. Report altitude in metres followed by “METRES” or in feet followed by “FEET”, when on QNH. Report “CLIMBING” (followed by the level) when climbing, or “DESCENDING” (followed by the level) when descending, to a new level after passing the significant point.

Item 5 — NEXT POSITION AND ESTIMATED TIME OVER. Report the next reporting point and the estimated time over such reporting point, or report the estimated position that will be reached one hour later, according to the position reporting procedures in force. Use the data conventions specified in Item 2 for position. Report the estimated time over this position. Report time in hours and minutes UTC (4 numerics) unless reporting time in minutes past the hour (2 numerics) as prescribed on the basis of regional air navigation agreements.

Item 6 — ENSUING SIGNIFICANT POINT. Report the ensuing significant point following the “next position and estimated time over”.

Section 2

Item 7 — ESTIMATED TIME OF ARRIVAL. Report the name of the aerodrome of the first intended landing, followed by the estimated time of arrival at this aerodrome in hours and minutes UTC (4 numerics).

Item 8 — ENDURANCE. Report “ENDURANCE” followed by fuel endurance in hours and minutes (4 numerics).

Section 3

Item 9 — PHENOMENON PROMPTING A SPECIAL AIR-REPORT. Report one of the following phenomena encountered or observed:

- moderate turbulence as “TURBULENCE MODERATE”
severe turbulence as “TURBULENCE SEVERE”

The following specifications apply:

Moderate — Conditions in which moderate changes in aircraft attitude and/or altitude may occur but the aircraft remains in positive control at all times. Usually, small variations in airspeed. Changes in accelerometer readings of 0.5 g to 1.0 g at the aircraft's centre of gravity. Difficulty in walking. Occupants feel strain against seat belts. Loose objects move about.

Severe — Conditions in which abrupt changes in aircraft attitude and/or altitude occur; aircraft may be out of control for short periods. Usually, large variations in airspeed. Changes in accelerometer readings greater than 1.0 g at the aircraft's centre of gravity. Occupants are forced violently against seat belts. Loose objects are tossed about.

- moderate icing as “ICING MODERATE”
severe icing as “ICING SEVERE”

The following specifications apply:

Moderate — Conditions in which change of heading and/or altitude may be considered desirable.

Severe — Conditions in which immediate change of heading and/or altitude is considered essential.

- Severe mountain wave as “MOUNTAINWAVE SEVERE”

The following specification applies:

Severe — Conditions in which the accompanying downdraft is 3.0 m/s (600 ft/min) or more and/or severe turbulence is encountered.

- Thunderstorm without hail as “THUNDERSTORM”
thunderstorm with hail as “THUNDERSTORM WITH HAIL”
- heavy duststorm or sandstorm as “DUSTSTORM or SANDSTORM HEAVY”

- volcanic ash cloud as “VOLCANIC ASH CLOUD”
- pre-eruption volcanic activity or a volcanic eruption as “PRE-ERUPTION VOLCANIC ACTIVITY or VOLCANIC ERUPTION”

The following specification applies:

Pre-eruption volcanic activity in this context means unusual and/or increasing volcanic activity which could presage a volcanic eruption.

Note.— In case of volcanic ash cloud, pre-eruption volcanic activity or volcanic eruption, in accordance with Chapter 4, 4.12.3, a post-flight report shall also be made on the special air-report of volcanic activity form (Model VAR).

- Good braking action as “BRAKING ACTION GOOD”
- Good to medium braking action as “BRAKING ACTION GOOD TO MEDIUM”
- Medium braking action as “BRAKING ACTION MEDIUM”
- Medium to poor braking action as “BRAKING ACTION MEDIUM TO POOR”
- Poor braking action as “BRAKING ACTION POOR”
- Less than poor braking action as “BRAKING ACTION LESS THAN POOR”

The following specifications apply [applicable as of 4 November 2021]:

Good — Braking deceleration is normal for the wheel braking effort applied and directional control is normal.

Good to medium — Braking deceleration or directional control is between Good and Medium.

Medium — Braking deceleration is noticeably reduced for the wheel braking effort applied or directional control is noticeably reduced.

Medium to poor — Braking deceleration or directional control is between Medium and Poor.

Poor — Braking deceleration is significantly reduced for the wheel braking effort applied or directional control is significantly reduced.

Less than poor — Braking deceleration is minimal to non-existent for the wheel braking effort applied or directional control is

uncertain.

2.2 Information recorded on the volcanic activity reporting form (Model VAR) is not for transmission by RTF but, on arrival at an aerodrome, is to be delivered without delay by the operator or a flight crew member to the aerodrome meteorological office. If such an office is not easily accessible, the completed form shall be delivered in accordance with local arrangements made between the meteorological and ATS authorities and the operator.

3. Forwarding of meteorological information received by voice communications

When receiving special air-reports, air traffic services units shall forward these air-reports without delay to the associated meteorological watch office (MWO). In order to ensure assimilation of air-reports in ground-based automated systems, the elements of such reports shall be transmitted using the data conventions specified below and in the order prescribed.

- ADDRESSEE. Record station called and, when necessary, relay required.
- MESSAGE TYPE DESIGNATOR. Record “ARS” for a special air-report.

Note.— Where air-reports are handled by automatic data processing equipment which cannot accept this message-type designator, in accordance with Chapter 11, 11.4.2.6.5.2, the use of a different message-type designator is permitted by regional air navigation agreement.

- AIRCRAFT IDENTIFICATION. Record the aircraft identification using the data convention specified for Item 7 of the flight plan, without a space between the operator’s designator and the aircraft registration or flight identification, if used (e.g. New Zealand 103 as ANZ103).

Section 1

Item 0 — POSITION. Record position in latitude (degrees as 2 numerics or degrees and minutes as 4 numerics, followed without a space by N or S) and longitude (degrees as 3 numerics or degrees and minutes as 5 numerics, followed without a space by E or W), or as a significant point identified by a coded designator (2 to 5 characters), or as a significant point followed by magnetic bearing (3 numerics) and distance in nautical miles (3 numerics) from the point (e.g. 4620N07805W , 4620N078W , 46N078W , LN, MAY, HADDY or DUB180040). Precede significant point by “ABM” (abeam), if applicable.

Item 1 — TIME. Record time in hours and minutes UTC (4 numerics).

Item 2 — FLIGHT LEVEL OR ALTITUDE. Record F followed by 3 numerics (e.g. F310), when a flight level is reported. Record altitude in metres followed by M or in feet followed by FT, when an altitude is reported. Record “ASC” (level) when climbing, or “DES” (level) when descending.

Section 3

Item 9 — PHENOMENON PROMPTING A SPECIAL AIR-REPORT. Record the phenomenon reported as follows:

- moderate turbulence as “TURB MOD”
- severe turbulence as “TURB SEV”
- moderate icing as “ICE MOD”
- severe icing as “ICE SEV”
- severe mountainwave as “MTW SEV”
- thunderstorm without hail as “TS”
- thunderstorm with hail as “TSGR”
- heavy sandstorm as “HVY SS”
- heavy duststorm as “HVY DS”
- volcanic ash cloud as “VA CLD”
- pre-eruption volcanic activity or a volcanic eruption as “VA”
- hail as “GR”

- cumulonimbus clouds as “CB”.
- TIME TRANSMITTED. Record only when Section 3 is transmitted.

2. Special air-report of volcanic activity form (Model VAR)

MODEL VAR: to be used for post-flight reporting

VOLCANIC ACTIVITY REPORT

Air-reports are critically important in assessing the hazards which volcanic ash cloud presents to aircraft operations.

2. Instructions for the completion of the flight plan form

2.1. General

Adhere closely to the prescribed formats and manner of specifying data.

Commence inserting data in the first space provided. Where excess space is available, leave unused spaces blank. *Insert* all clock times in 4 figures UTC.

Insert all estimated elapsed times in 4 figures (hours and minutes).

Shaded area preceding Item 3 — to be completed by ATS and COM services, unless the responsibility for originating flight plan messages has been delegated.

Note.— The term “aerodrome” where used in the flight plan is intended to cover also sites other than aerodromes which may be used by certain types of aircraft, e.g. helicopters or balloons.

2.2. Instructions for insertion of ATS data

Complete Items 7 to 18 as indicated hereunder.

Complete also Item 19 as indicated hereunder, when so required by the appropriate ATS authority or when otherwise deemed necessary.

Note 1.— Item numbers on the form are not consecutive, as they correspond to Field Type numbers in ATS messages.

Note 2.— Air traffic services data systems may impose communications or processing constraints on information in filed flight plans. Possible constraints may, for example, be limits with regard to item length, number of elements in the route item or total flight plan length. Significant constraints are documented in the relevant Aeronautical Information Publication.

| |
|---|
| ITEM 7: AIRCRAFT IDENTIFICATION (MAXIMUM 7 CHARACTERS) |
|---|

INSERT one of the following aircraft identifications, not exceeding 7 alphanumeric characters and without hyphens or symbols:

- a. the ICAO designator for the aircraft operating agency followed by the flight identification (e.g. KLM511, NGA213, JTR25) when in radiotelephony the call sign to be used by the aircraft will consist of the ICAO telephony designator for the operating agency followed by the flight identification (e.g. KLM511, NIGERIA 213, JESTER 25);

OR

- b. the nationality or common mark and registration mark of the aircraft (e.g. EIAKO, 4XBCD, N2567GA), when:
 - i. in radiotelephony the call sign to be used by the aircraft will consist of this identification alone (e.g. CGAJS), or preceded by the ICAO telephony designator for the aircraft operating agency (e.g. BLIZZARD CGAJS);
 - ii. the aircraft is not equipped with radio.

Note 1.— Standards for nationality, common and registration marks to be used are contained in Annex 7, Chapter 2.

Note 2.— Provisions for the use of radiotelephony call signs are contained in Annex 10, Volume II, Chapter 5. ICAO designators and telephony designators for aircraft operating agencies are contained in Doc 8585 — Designators for Aircraft Operating Agencies, Aeronautical Authorities and Services.

| |
|---|
| ITEM 8: FLIGHT RULES AND TYPE OF FLIGHT (ONE OR TWO CHARACTERS) |
|---|

| |
|---------------------|
| Flight rules |
|---------------------|

INSERT one of the following letters to denote the category of flight rules with which the pilot intends to comply:

I if it is intended that the entire flight will be operated under the IFR V if it is intended

that the entire flight will be operated under the VFR

- Y if the flight initially will be operated under the IFR, followed by one or more subsequent changes of flight rules or
- Z if the flight initially will be operated under the VFR, followed by one or more subsequent changes of flight rules

Specify in Item 15 the point or points at which a change of flight rules is planned.

| |
|----------------|
| Type of flight |
|----------------|

INSERT one of the following letters to denote the type of flight when so required by the appropriate ATS authority:

- S if scheduled air service
- N if non-scheduled air transport operation G if general aviation
- M if military
- X if other than any of the defined categories above.

Specify status of a flight following the indicator STS in Item 18, or when necessary to denote other reasons for specific handling by ATS, indicate the reason following the indicator RMK in Item 18.

| |
|---|
| ITEM 9: NUMBER AND TYPE OF AIRCRAFT AND WAKE TURBULENCE CATEGORY |
|---|

| |
|--|
| Number of aircraft (1 or 2 characters) |
|--|

INSERT the number of aircraft, if more than one.

| |
|--------------------------------------|
| Type of aircraft (2 to 4 characters) |
|--------------------------------------|

INSERT the appropriate designator as specified in ICAO Doc 8643, *Aircraft Type Designators*,

OR, if no such designator has been assigned, or in case of formation flights comprising more than one type,

INSERT ZZZZ, and *SPECIFY* in Item 18, the (numbers and) type(s) of aircraft preceded by TYPE

Wake turbulence category (1 character)

INSERT an oblique stroke followed by one of the following letters to indicate the wake turbulence category of the aircraft:

- J — SUPER, to indicate an aircraft type specified as such in ICAO Doc 8643, Aircraft Type Designators;
- H — HEAVY, to indicate an aircraft type with a maximum certificated take-off mass of 136 000 kg or more, with the exception of aircraft types listed in Doc 8643 in the SUPER (J) category;
- M — MEDIUM, to indicate an aircraft type with a maximum certificated take-off mass of less than 136 000 kg but more than 7 000 kg;
- L — LIGHT, to indicate an aircraft type with a maximum certificated take-off mass of 7 000 kg or less.

ITEM 10: EQUIPMENT AND CAPABILITIES

Capabilities comprise the following elements:

- a. presence of relevant serviceable equipment on board the aircraft;
- b. equipment and capabilities commensurate with flight crew qualifications; and
- c. where applicable, authorization from the appropriate authority.

Radio communication, navigation and approach aid equipment and capabilities

INSERT one letter as follows:

N if no COM/NAV/approach aid equipment for the route to be flown is carried, or the equipment is unserviceable,

OR S if standard COM/NAV/approach aid equipment for the route to be flown is carried and serviceable (*see Note 1*),

AND/OR

INSERT one or more of the following letters to indicate the serviceable COM/NAV/approach aid equipment and capabilities available:

| | | | |
|----|---|-------|--|
| A | GBAS landing system | J6 | CPDLC FANS 1/A SATCOM (MTSAT) |
| B | LPV (APV with SBAS) | J7 | CPDLC FANS 1/A SATCOM (Iridium) |
| C | LORAN C | K | MLS |
| D | DME | L | ILS |
| E1 | FMC WPR ACARS | M1 | ATC SATVOICE (INMARSAT) M2 ATC SATVOICE (MTSAT) |
| E2 | D-FIS ACARS | M3 | ATC SATVOICE (Iridium) O VOR |
| E3 | PDC ACARS F ADF | P1 | CPDLC RCP 400 (<i>See Note 7</i>) |
| G | GNSS. If any portion of the flight is planned to be conducted under IFR, it refers to GNSS receivers that comply with the requirements of Annex 10, Volume I (<i>See Note 2</i>) | P2 | CPDLC RCP 240 (<i>See Note 7</i>) |
| H | HF RTF | P3 | SATVOICE RCP 400 (<i>See Note 7</i>) |
| I | Inertial Navigation | P4-P9 | Reserved for RCP |
| J1 | CPDLC ATN VDL Mode 2 (<i>See Note 3</i>) | R | PBN approved (<i>See Note 4</i>) |
| J2 | CPDLC FANS 1/A HFDL | T | TACAN |
| J3 | CPDLC FANS 1/A VDL Mode A | U | UHF RTF |
| J4 | CPDLC FANS 1/A VDL Mode 2 | V | VHF RTF |
| J5 | CPDLC FANS 1/A SATCOM (INMARSAT) | W | RVSM approved |
| | | X | MNPS approved |
| | | Y | VHF with 8.33 kHz channel spacing capability |
| | | Z | Other equipment carried or other capabilities (<i>See Note 5</i>) |

Any alphanumeric characters not indicated above are reserved.

Note 1.— If the letter S is used, standard equipment is considered to be VHF RTF, VOR and ILS, unless another combination is prescribed by the appropriate ATS authority.

Note 2.— If the letter G is used, the types of external GNSS augmentation, if any, are specified in Item 18 following the indicator NAV/ and separated by a space.

Note 3.— See RTCA/EUROCAE Interoperability Requirements Standard for ATN Baseline 1 (ATN B1 INTEROP Standard- DO-280B/ED-110B) for data link services air traffic control clearance and information/air traffic control communications management/air traffic control microphone check.

Note 4.— If the letter R is used, the performance-based navigation levels that can be met are specified in Item 18 following the indicator PBN/. Guidance material on the application of performance-based navigation to a specific route segment, route or area is contained in the Performance-based Navigation(PBN) Manual (Doc 9613).

Note 5.— If the letter Z is used, specify in Item 18 the other equipment carried or other capabilities, preceded by COM/, NAV/ and/or DAT, as appropriate.

Note 6.— Information on navigation capability is provided to ATC for clearance and routing purposes.

Note 7.— Guidance material on the application of performance-based communication, which prescribes RCP to an air traffic service in a specific area, is contained in the Performance-based Communication and Surveillance (PBCS) Manual (Doc 9869).

| |
|--|
| Surveillance equipment and capabilities |
|--|

INSERT N if no surveillance equipment for the route to be flown is carried, or the equipment is unserviceable,

OR

INSERT one or more of the following descriptors, to a maximum of 20 characters, to describe the serviceable surveillance equipment and/or capabilities on board:

SSR Modes A and C

A Transponder — Mode A (4 digits — 4 096 codes)

C Transponder — Mode A (4 digits — 4 096 codes) and Mode C

SSR Mode S

E Transponder — Mode S, including aircraft identification, pressure-altitude and extended squitter (ADS-B) capability

H Transponder — Mode S, including aircraft identification, pressure-altitude and enhanced surveillance capability

I Transponder — Mode S, including aircraft identification, but no pressure-altitude capability

L Transponder — Mode S, including aircraft identification, pressure-altitude, extended squitter (ADS-B) and enhanced surveillance capability

P Transponder — Mode S, including pressure-altitude, but no aircraft identification capability

S Transponder — Mode S, including both pressure altitude and aircraft identification capability

X Transponder — Mode S with neither aircraft identification nor pressure-altitude capability

Note.— Enhanced surveillance capability is the ability of the aircraft to down-link aircraft derived data via a Mode S transponder.

ADS-B

B1 ADS-B with dedicated 1 090 MHz ADS-B “out” capability

B2 ADS-B with dedicated 1 090 MHz ADS-B “out” and “in” capability

U1 ADS-B “out” capability using UAT

U2 ADS-B “out” and “in” capability using UAT

V1 ADS-B “out” capability using VDL Mode 4

V2 ADS-B “out” and “in” capability using VDL Mode 4

ADS-C

D1 ADS-C with FANS 1/A capabilities

G1 ADS-C with ATN capabilities

Alphanumeric characters not indicated above are reserved.

Example: ADE3RV/HB2U2V2G1

Note 1.— The RSP specification(s), if applicable, will be listed in Item 18 following the indicator SUR/. Guidance material on the application of performance-based surveillance, which prescribes RSP to an air traffic service in a specific area, is contained in the Performance-based Communication and Surveillance (PBCS) Manual (Doc 9869).

Note 2.— Additional surveillance equipment or capabilities will be listed in Item 18 following the indicator SUR/, as required by the appropriate ATS authority.

ITEM 13: DEPARTURE AERODROME AND TIME (8 CHARACTERS)

INSERT the ICAO four-letter location indicator of the departure aerodrome as specified in Doc 7910, *Location Indicators*,

OR, if no location indicator has been assigned,

INSERT ZZZZ and *SPECIFY*, in Item 18, the name and location of the aerodrome preceded by DEP/,

OR, the first point of the route or the marker radio beacon preceded by DEP/..., if the aircraft has not taken off from the aerodrome,

OR, if the flight plan is received from an aircraft in flight,

INSERT AFIL, and *SPECIFY*, in Item 18, the ICAO four-letter location indicator of the location of the ATS unit from which supplementary flight plan data can be obtained, preceded by DEP/

THEN, WITHOUT A SPACE,

INSERT for a flight plan submitted before departure, the estimated off-block time (EOBT),

OR, for a flight plan received from an aircraft in flight, the actual or estimated time over the first point of the route to which the flight plan applies.

| |
|----------------------|
| ITEM15: ROUTE |
|----------------------|

INSERT the *first cruising speed* as in (a) and the *first cruising level* as in (b), without a space between them. *THEN*, following the arrow, *INSERT* the route description as in (c).

| |
|---|
| (a) Cruising speed (maximum 5 characters) |
|---|

INSERT the *True airspeed* for the first or the whole cruising portion of the flight, in terms of:

Kilometres per hour, expressed as K followed by 4 figures (e.g. K0830), *or*

Knots, expressed as N followed by 4 figures (e.g. N0485), *or*

True Mach number, when so prescribed by the appropriate ATS authority, to the nearest hundredth of unit Mach, expressed as M followed by 3 figures (e.g. M082).

| |
|---|
| (b) Cruising level (maximum 5 characters) |
|---|

INSERT the planned cruising level for the first or the whole portion of the route to be flown, in terms of:

Flight level, expressed as F followed by 3 figures (e.g. F085; F330), *or*

**Standard metric level in tens of metres*, expressed as S followed by 4 figures (e.g. S1130), *or Altitude in hundreds of feet*, expressed as A followed by 3 figures (e.g. A045; A100), *or*

* When so prescribed by the appropriate ATS authorities.

Altitude in tens of metres, expressed as M followed by 4 figures (e.g. M0840), or for uncontrolled VFR flights, the letters VFR.

| |
|---|
| (c) Route (including changes of speed, level and/or flight rules) |
|---|

Flights along designated ATS routes

INSERT, if the departure aerodrome is located on or connected to the ATS route, the designator of the first ATS route,

OR, if the departure aerodrome is not on or connected to the ATS route, the letters DCT followed by the point of joining the first ATS route, followed by the designator of the ATS route.

THEN

INSERT each point at which either a change of speed and/or level is planned to commence, or a change of ATS route, and/or a change of flight rules is planned,

Note.— When a transition is planned between a lower and upper ATS route and the routes are oriented in the same direction, the point of transition need not be inserted.

FOLLOWED IN EACH CASE

by the designator of the next ATS route segment, even if the same as the previous one,

OR by DCT, if the flight to the next point will be outside a designated route, unless both points are defined by geographical coordinates.

Flights outside designated ATS routes

INSERT points normally not more than 30 minutes flying time or 370 km (200 NM) apart, including each point at which a change of speed or level, a change of track, or a change of flight rules is planned.

OR, when required by appropriate ATS authority(ies),

DEFINE the track of flights operating predominantly in an east-west direction between 70°N and 70°S by reference to significant points formed by the intersections of half or whole degrees of latitude with meridians spaced at intervals of 10 degrees of longitude. For flights operating in areas outside those latitudes the tracks shall be defined by significant points formed by the intersection of parallels of latitude with meridians normally spaced at 20 degrees of longitude. The distance between significant points shall, as far as possible, not exceed one hour's flight time. Additional significant points shall be established as deemed necessary.

For flights operating predominantly in a north-south direction, define tracks by reference to significant points formed by the intersection of whole degrees of longitude with specified parallels of latitude which are spaced at 5 degrees.

INSERT DCT between successive points unless both points are defined by geographical coordinates or by bearing and distance.

USE ONLY the conventions in (1) to (5) below and *SEPARATE* each sub-item by a space.

1. ATS route (2 to 7 characters)

The coded designator assigned to the route or route segment including, where appropriate, the coded designator assigned to the standard departure or arrival route (e.g. BCN1, B1, R14, UB10, KODAP2A).

Note.— Provisions for the application of route designators are contained in CAR 11, Appendix

1. Significant point (2 to 11 characters)

- 2.

The coded designator (2 to 5 characters) assigned to the point (e.g. LN, MAY, HADDY), *or*, if no coded designator has been assigned, one of the following ways:

— *Degrees only* (7 characters):

2 figures describing latitude in degrees, followed by “N” (North) or “S” (South),

followed by 3 figures describing longitude in degrees, followed by “E” (East) or “W” (West). Make up the correct number of figures, where necessary, by insertion of zeros, e.g. 46N078W.

— *Degrees and minutes* (11 characters):

4 figures describing latitude in degrees and tens and units of minutes followed by “N” (North) or “S” (South), followed by 5 figures describing longitude in degrees and tens and units of minutes, followed by “E” (East) or “W” (West). Make up the correct number of figures, where necessary, by insertion of zeros, e.g. 4620N07805W.

— *Bearing and distance from a reference point*:

The identification of the reference point, followed by the bearing from the point in the form of 3 figures giving degrees magnetic, followed by the distance from the point in the form of 3 figures expressing nautical miles. In areas of high latitude where it is determined by the appropriate authority that reference to degrees magnetic is impractical, degrees true may be used. Make up the correct number of figures, where necessary, by insertion of zeros — e.g. a point 180° magnetic at a distance of 40 nautical miles from VOR “DUB” should be expressed as DUB180040.

3.

Change of speed or level
(maximum 21 characters)

The point at which a change of speed (5% TAS or 0.01 Mach or more) or a change of level is planned to commence, expressed exactly as in (2) above, followed by an oblique stroke and both the cruising speed and the cruising level, expressed exactly as in (a) and (b) above, without a space between them, even when only one of these quantities will be changed.

Examples: LN/N0284A045
 MAY/N0305F180
 HADDY/N0420F330
 4602N07805W/N0500F350

46N078W/M082F330

DUB180040/N0350M0840

4.

Change of flight rules
(maximum 3 characters)

The point at which the change of flight rules is planned, expressed exactly as in (2) or (3) above as appropriate, followed by a space and one of the following:

VFR if from IFR to VFR IFR if from VFR to IFR

Examples: LN VFR

LN/N0284A050 IFR

5.

Cruise climb (maximum 28 characters)

The letter C followed by an oblique stroke; THEN the point at which cruise climb is planned to start, expressed exactly as in (2) above, followed by an oblique stroke; THEN the speed to be maintained during cruise climb, expressed exactly as in (a) above, followed by the two levels defining the layer to be occupied during cruise climb, each level expressed exactly as in (b) above, or the level above which cruise climb is planned followed by the letters PLUS, without a space between them.

Examples: C/48N050W/M082F290F350

C/48N050W/M082F290PLUS

C/52N050W/M220F580F620.

**ITEM 16: DESTINATION AERODROME AND TOTAL
ESTIMATED ELAPSED TIME, DESTINATION
ALTERNATE AERODROME(S)**

Destination aerodrome and total
estimated elapsed time (8 characters)

INSERT the ICAO four-letter location indicator of the destination aerodrome as specified in Doc 7910, *Location Indicators*,

OR, if no location indicator has been assigned,

INSERT ZZZZ and *SPECIFY* in Item 18 the name and location of the aerodrome, preceded by *DEST/ THEN*

WITHOUT A SPACE

INSERT the total estimated elapsed time.

Note.— For a flight plan received from an aircraft in flight, the total estimated elapsed time is the estimated time from the first point of the route to which the flight plan applies to the termination point of the flight plan.

| |
|------------------------------------|
| Destination alternate aerodrome(s) |
|------------------------------------|

INSERT the ICAO four-letter location indicator(s) of not more than two destination alternate aerodromes, as specified in Doc 7910, *Location Indicators*, separated by a space,

OR, if no location indicator has been assigned to the destination alternate aerodrome(s),

INSERT ZZZZ and *SPECIFY* in Item 18 the name and location of the destination alternate aerodrome(s), preceded by *ALTN/* .

| |
|-----------------------------------|
| ITEM 18: OTHER INFORMATION |
|-----------------------------------|

Note.— Use of indicators not included under this item may result in data being rejected, processed incorrectly or lost.

Hyphens or oblique strokes should only be used as prescribed below.

INSERT 0 (zero) if no other information,

OR, any other necessary information in the sequence shown hereunder, in the form of the appropriate indicator selected from those defined hereunder followed by an oblique stroke and the information to be recorded:

STS/ Reason for special handling by ATS, e.g. a search and rescue mission, as follows:

- ALTRV:** for a flight operated in accordance with an altitude reservation;
- ATFMX:** for a flight approved for exemption from ATFM measures by the appropriate ATS authority;
- FFR:** fire-fighting;
- FLTCK:** flight check for calibration of nav aids;
- HAZMAT:** for a flight carrying hazardous material;
- HEAD:** a flight with Head of State status;
- HOSP:** for a medical flight declared by medical authorities;
- HUM:** for a flight operating on a humanitarian mission;
- MARSA:** for a flight for which a military entity assumes responsibility for separation of military aircraft;
- MEDEVAC:** for a life critical medical emergency evacuation;
- NONRVSM:** for a non-RVSM capable flight intending to operate in RVSM airspace;
- SAR:** for a flight engaged in a search and rescue mission; and
- STATE:** for a flight engaged in military, customs or police services.

Other reasons for special handling by ATS shall be denoted under the designator **RMK/**.

PBN/ Indication of RNAV and/or RNP capabilities. Include as many of the descriptors below, as apply to the flight, up to a maximum of 8 entries, i.e. a total of not more than 16 characters.

| | |
|----|----------------------------|

Combinations of alphanumeric characters not indicated above are reserved.

NAV/ Significant data related to navigation equipment, other than specified in PBN/, as required by the appropriate ATS authority. Indicate GNSS augmentation under this indicator, with a space between two or more methods of augmentation, e.g. NAV/GBASSBAS.

COM/ Indicate communication equipment and capabilities not specified in Item 10 a). DAT/ Indicate data communication equipment and capabilities not specified in 10 a).

SUR/ Indicate surveillance equipment and capabilities not specified in Item 10 b). Indicate as many RSP specification(s) as apply to the flight, using designator(s) with no space. Multiple RSP specifications are separated by a space. Example: RSP180 RSP400.

DEP/ Name and location of departure aerodrome, if ZZZZ is inserted in Item 13, or the ATS unit from which supplementary flight plan data can be obtained, if AFIL is inserted in Item 13. For aerodromes not listed in the relevant Aeronautical Information Publication, indicate location as follows:

With 4 figures describing latitude in degrees and tens and units of minutes followed by “N” (North) or “S” (South), followed by 5 figures describing longitude in degrees and tens and units of minutes, followed by “E” (East) or “W” (West). Make up the correct number of figures, where necessary, by insertion of zeros, e.g. 4620N07805W (11 characters).

OR, Bearing and distance from the nearest significant point, as follows:

The identification of the significant point followed by the bearing from the point in the form of 3 figures giving degrees magnetic, followed by the distance from the point in the form of 3 figures expressing nautical miles. In areas of high latitude where it is determined by the appropriate authority that reference to degrees magnetic is impractical, degrees true may be used. Make up the correct number of figures, where necessary, by insertion of zeros, e.g. a point of 180° magnetic at a distance of 40 nautical miles from VOR “DUB” should be expressed as DUB180040.

OR, The first point of the route (name or LAT/LONG) or the marker radio beacon, if the aircraft

has not taken off from an aerodrome.

DEST/ Name and location of destination aerodrome, if ZZZZ is inserted in Item 16. For aerodromes not listed in the relevant Aeronautical Information Publication, indicate location in LAT/LONG or bearing and distance from the nearest significant point, as described under DEP/above.

DOF/ The date of flight departure in a six-figure format (YYMMDD, where YY equals the year, MM equals the month and DD equals the day).

REG/ The nationality or common mark and registration mark of the aircraft, if different from the aircraft identification in Item 7.

EET/ Significant points or FIR boundary designators and accumulated estimated elapsed times from take-off to such points or FIR boundaries, when so prescribed on the basis of regional air navigation agreements, or by the appropriate ATS authority.

Examples: EET/CAP0745 XYZ0830

EET/EINN0204

SEL/ SELCAL Code, for aircraft so equipped.

TYP/ Type(s) of aircraft, preceded if necessary without a space by number(s) of aircraft and separated by one space, if ZZZZ is inserted in Item 9.

Example: TYP/2F15 5F5 3B2

CODE/ Aircraft address (expressed in the form of an alphanumerical code of six hexadecimal characters) when required by the appropriate ATS authority. Example: "F00001" is the lowest aircraft address contained in the specific block administered by ICAO.

DLE/ Enroute delay or holding, insert the significant point(s) on the route where a delay is planned to occur, followed by the length of delay using four-figure time in hours and minutes (hhmm).

Example: DLE/MDG0030

OPR/ ICAO designator or name of the aircraft operating agency, if different from the aircraft identification in item 7.

ORGN/ The originator's 8 letter AFTN address or other appropriate contact details, in cases where the originator of the flight plan may not be readily identified, as required by the appropriate ATS authority.

Note.— In some areas, flight plan reception centres may insert the ORGN/ identifier and originator's AFTN address automatically.

PER/ Aircraft performance data, indicated by a single letter as specified in the *Procedures for Air Navigation Services — Aircraft Operations* (PANS-OPS, Doc 8168), *Volume I — Flight Procedures*, if so prescribed by the appropriate ATS authority.

ALTN/ Name of destination alternate aerodrome(s), if ZZZZ is inserted in Item 16. For aerodromes not listed in the relevant Aeronautical Information Publication, indicate location in LAT/LONG or bearing and distance from the nearest significant point, as described in DEP/ above.

RALT/ ICAO four letter indicator(s) for en-route alternate(s), as specified in Doc 7910, *Location Indicators*, or name(s) of en-route alternate aerodrome(s), if no indicator is allocated. For aerodromes not listed in the relevant Aeronautical Information Publication, indicate location in LAT/LONG or bearing and distance from the nearest significant point, as described in DEP/ above.

TALT/ ICAO four letter indicator(s) for take-off alternate, as specified in Doc 7910, *Location Indicators*, or name of take-off alternate aerodrome, if no indicator is allocated. For aerodromes not listed in the relevant Aeronautical Information Publication, indicate location in LAT/LONG or bearing and distance from the nearest significant point, as described in DEP/ above.

RIF/ The route details to the revised destination aerodrome, followed by the ICAO four-letter location indicator of the aerodrome. The revised route is subject to reclearance in flight.

Examples: RIF/DTA HEC KLAX

RIF/ESP G94 CLA YPPH

RMK/ Any other plain-language remarks when required by the appropriate ATS authority or deemed necessary.

| |
|---|
| ITEM 19: SUPPLEMENTARY INFORMATION |
|---|

| |
|------------------|
| Endurance |
|------------------|

| |
|-------------------------|
| Persons on board |
|-------------------------|

After E/ *INSERT* a 4-figure group giving the fuel endurance in hours and minutes.

After P/ *INSERT* the total number of persons (passengers and crew) on board, when required by the appropriate ATS authority. *INSERT* TBN (to be notified) if the total number of persons is not known at the time of filing.

| |
|---|
| Emergency and survival equipment |
|---|

R/ (RADIO) *CROSS OUT* U if UHF on frequency 243.0 MHz is not available.
 CROSS OUT V if VHF on frequency 121.5 MHz is not available.
 CROSS OUT E if emergency locator transmitter (ELT) is not available.

S/(SURVIVAL EQUIPMENT) *CROSS OUT* all indicators if survival equipment is not carried.
 CROSS OUT P if polar survival equipment is not carried. *CROSS OUT* D if desert survival equipment is not carried. *CROSS OUT* M if maritime survival equipment is not carried. *CROSS OUT* J if jungle survival equipment is not carried.

J/ (JACKETS) *CROSS OUT* all indicators if life jackets are not carried. *CROSS*

| | |
|--------------------------------------|---|
| | <i>OUT L</i> if life jackets are not equipped with lights. <i>CROSS OUT F</i> if life jackets are not equipped with fluorescein. <i>CROSS OUT U</i> or <i>V</i> or both as in R/ above to indicate radio capability of jackets, if any. |
| D/(DINGHIES) (NUMBER) | <i>CROSS OUT</i> indicators D and C if no dinghies are carried, or <i>INSERT</i> number of dinghies carried; and |
| (CAPACITY) | <i>INSERT</i> total capacity, in persons, of all dinghies carried; and |
| (COVER) | <i>CROSS OUT</i> indicator C if dinghies are not covered; and |
| (COLOUR) | <i>INSERT</i> colour of dinghies if carried. |
| A/ (AIRCRAFT COLOUR AND MARKINGS) | <i>INSERT</i> colour of aircraft and significant markings. |
| N/ (REMARKS) | <i>CROSS OUT</i> indicator N if no remarks, or <i>INDICATE</i> any other survival equipment carried and any other remarks regarding survival equipment. |
| C/ (PILOT) | <i>INSERT</i> name of pilot-in-command. |

2.3. Filed by

INSERT the name of the unit, agency or person filing the flight plan.

2.4. Acceptance of the flight plan

Indicate acceptance of the flight plan in the manner prescribed by the appropriate ATS authority.

2.5. Instructions for insertion of COM data

Items to be completed

COMPLETE the top two shaded lines of the form, and *COMPLETE* the third shaded line only when necessary, in accordance with the provisions in PANS-ATM, Chapter 11, 11.2.1.2, unless

ATS prescribes otherwise.

1. Instructions for the transmission of a filed flight plan (FPL) message

Correction of obvious errors

Unless otherwise prescribed, *CORRECT* obvious format errors and/or omissions (i.e. oblique strokes) to ensure adherence as specified in Section 2.

Items to be transmitted

TRANSMIT items as indicated hereunder, unless otherwise prescribed:

- a. the items in the shaded lines, above Item 3;

- b. commencing with <<≡ (FPL of Item 3:

all symbols and data in the unshaded boxes down to the)<<≡ at the end of Item 18,

additional alignment functions as necessary to prevent the inclusion of more than 69 characters in any line of Items 15 or 18. The alignment function is to be inserted only in lieu of a space so as not to break up a group of data,

letter shifts and figure shifts (not preprinted on the form) as necessary;

- c. the AFTN Ending, as described below:

End-of-Text Signal

- i. one LETTER SHIFT
- ii. two CARRIAGE RETURNS, one LINE FEED

Page-feed Sequence

Seven LINE FEEDS

End-of-Message Signal

Four of the letter N.

2. Instructions for the transmission of a supplementary flight plan (SPL) message

Items to be transmitted

Transmit items as indicated hereunder, unless otherwise prescribed:

- a. AFTN Priority Indicator, Addressee Indicators <<≡, Filing Time, Originator Indicator <<≡ and, if necessary, specific identification of addressees and/or originator;

- b. commencing with <<≡(SPL:

all symbols and data in the unshaded areas of boxes 7, 13, 16 and 18, except that the ‘)’ at the end of box 18 is *not* to be transmitted, and then the symbols in the unshaded area of box 19 down to and including the)<<≡ of box 19,

additional alignment functions as necessary to prevent the inclusion of more than 69 characters in any line of Items 18 and 19. The alignment function is to be inserted only in lieu of a space so as not to break up a group of data,

letter shifts and figure shifts (not preprinted on the form) as necessary;

- c. the AFTN Ending, as described below:

End-of-Text Signal

- i. one LETTER SHIFT
- ii. two CARRIAGE RETURNS, one LINE FEED

Page-feed Sequence

Seven LINE FEEDS

End-of-Message Signal

Four of the letter N.

6. ICAO model repetitive flight plan (RPL) listing form

22/11/07[illegible]

A2-20

6. ICAO model repetitive flight plan (RPL) listing form

Air Traffic Management (PANS-ATM)

7. Instructions for the completion of the repetitive flight plan (RPL) listing form

7.1. General

List only flight plans that will operate in accordance with IFR. (Flight rules I in FPL format).

It is assumed that all aircraft are operating as scheduled flights (Type of flight S in FPL format), otherwise *notify* in Q (Remarks).

It is assumed that all aircraft operating on RPLs are equipped with 4 096-code transponders with Modes A and C. Otherwise, *notify* in Q (Remarks).

List flight plans in *alphabetical order of the location indicator of the departure aerodrome*.

List flight plans for each departure aerodrome in chronological order of estimated off-block times.

Adhere closely to the data conventions as indicated for the Flight Plan Form (Appendix 3, 1.6) unless otherwise specifically indicated in 7.4.

Insert all clock times in 4 figures UTC.

Insert all estimated elapsed times in 4 figures (hours and minutes).

Insert data on a separate line for each segment of operations with one or more stops, i.e. from any departure aerodrome to the next destination aerodrome even though call sign or flight number is the same for multiple segments.

Clearly identify additions and deletions in accordance with Item H at 7.4. Subsequent listings shall list the corrected and added data, and deleted flight plans shall be omitted.

Number pages by indicating number of page and total number of pages in submission.

Utilize more than one line for any RPL where the space provided for items O and Q on one line is not sufficient.

7.2. A flight shall be cancelled as follows:

- a. indicate a minus sign in Item H followed by all other items of the cancelled flight;
- b. insert a subsequent entry denoted by a plus sign in Item H and the date of the last flight in Item J, with all other items of the cancelled flight unchanged.

7.3. Modification to a flight shall be made as follows:

- a. carry out the cancellation as indicated in 7.2;
- b. insert a third entry giving the new flight plan(s) with the appropriate items modified as necessary, including the new validity dates in Items I and J.

Note.— All entries related to the same flight will be inserted in succession in the order specified above.

7.4. Instructions for insertion of RPL data

Complete Items A to Q as indicated hereunder.

ITEM A: OPERATOR

INSERT name of operator.

ITEM B: ADDRESSEE(S)

INSERT name of agency(ies) designated by States to administer RPLs for FIRs or areas of responsibility concerned with the route of flight.

ITEM C: DEPARTURE AERODROME(S)

INSERT location indicator(s) of departure aerodrome(s).

ITEM D: DATE

INSERT on each page of submission the date (year, month, day) in a 6-figure group that the listing was submitted.

ITEM E: SERIAL NO.

INSERT serial number of submission (2 numerics) indicating last two digits of year, a dash, and the sequential no. of the submission for the year indicated (start with numeral 1 each new year).

ITEM F: PAGE OF

INSERT page number and total number of pages submitted.

ITEM G: SUPPLEMENTARY DATA AT

INSERT name and appropriate contact details of entity where information normally provided under Item 19 of the FPL is kept readily available and can be supplied without delay.

ITEM H: ENTRY TYPE

INSERT a minus sign (-) for each flight plan that is to be deleted from the listing.

INSERT a plus sign (+) for each initial listing and, in the case of subsequent submissions, for each flight plan not listed in the previous submission.

Note.— No information is required under this item for any flight plan which is unchanged from the previous submission.

ITEM I: VALID FROM

INSERT first date (year, month, day) upon which the flight is scheduled to operate.

ITEM J: VALID UNTIL

INSERT last date (year, month, day) upon which the flight is scheduled to operate as listed, or UFN if the duration is unknown.

ITEM K: DAYS OF OPERATION

INSERT number corresponding to the day of the week in the appropriate column; Monday = 1 through Sunday = 7.

INSERT 0 for each day of non-operation in the appropriate column.

| |
|--|
| ITEM L: AIRCRAFT IDENTIFICATION |
|--|

(Item 7 of the ICAO flight plan)

INSERT aircraft identification to be used for the flight.

| |
|--|
| ITEM M: TYPE OF AIRCRAFT WAKE TURBULENCE CATEGORY |
|--|

(Item 9 of the ICAO flight plan)

INSERT appropriate ICAO designator as specified in ICAO Doc 8643 — *Aircraft Type Designators*.

INSERT J, H, M or L indicator as appropriate:

- | |
|--|
| <p>J — SUPER, to indicate an aircraft type specified as such in ICAO Doc 8643, Aircraft Type Designators;</p> <p>H — HEAVY, to indicate an aircraft type with a maximum certificated take-off mass of 136 000 kg or more, with the exception of aircraft types listed in Doc 8643 in the SUPER (J) category;</p> <p>M — MEDIUM, to indicate an aircraft type with a maximum certificated take-off mass of less than 136 000 kg but more than 7 000 kg;</p> <p>L — LIGHT, to indicate an aircraft type with a maximum certificated take-off mass of 7 000 kg or less.</p> |
|--|

| |
|---|
| ITEM N: DEPARTURE AERODROME AND TIME |
|---|

(Item 13 of the ICAO flight plan)

INSERT location indicator of the departure aerodrome.

INSERT the off-block time, i.e. the estimated time that the aircraft will commence movement associated with departure.

| |
|---------------------|
| ITEMO: ROUTE |
|---------------------|

(Item 15 of the ICAO flight plan)

| |
|--------------------|
| (a) Cruising speed |
|--------------------|

INSERT the true airspeed for the first or whole cruising portion of the flight in accordance with Item 15 (a) of the ICAO flight plan.

| |
|--------------------|
| (b) Cruising level |
|--------------------|

INSERT the planned cruising level for the first or whole portion of the route in accordance with Item 15 (b) of the ICAO flight plan.

| |
|-----------|
| (c) Route |
|-----------|

INSERT the entire route in accordance with Item 15 (c) of the ICAO flight plan.

| |
|--|
| ITEMP: DESTINATION AERODROME AND TOTAL ESTIMATED ELAPSED TIME |
|--|

(Item 16 of the ICAO flight plan)

INSERT location indicator of the destination aerodrome.

INSERT the total estimated elapsed time.

| ITEMQ: | REMARKS |
|--------|---------|
|--------|---------|

INSERT items of information as required by the appropriate ATS authority, items normally notified in Item 18 of the ICAO flight plan and any other information pertinent to the flight of concern to ATS.

Appendix 3

FLIGHT PLAN

1. Message contents, formats and data conventions
2. Examples of ATS messages

1. Message contents, formats and data conventions

Note.— To facilitate description of the content and format of air traffic services messages, both for interchange between units without automatic data processing equipment and for interchange between air traffic control computers, the elements of data to be included in the message are grouped into “fields”. Each field contains a single element or a group of related elements.

1.1 The standard types of message

The standard types of message established for the interchange of ATS data, together with the associated message type designators, are as follows:

| <i>Message category</i> | <i>Message type</i> | <i>Message type designator</i> |
|---|-----------------------------------|--------------------------------|
| Emergency | Alerting | ALR |
| | Radio communication failure | RCF |
| Filed flight plan and associated update | Filed flight plan | FPL |
| | Modification | CHG |
| | Cancellation | CNL |
| | Delay | DLA |
| | Departure | DEP |
| | Arrival | ARR |
| | | |
| Coordination | Current flight plan | CPL |
| | Estimate | EST |
| | Coordination | CDN |
| | Acceptance | ACP |
| | Logical acknowledgement | LAM |
| Supplementary | Request flight plan | RQP |
| | Request supplementary flight plan | RQS |
| | Supplementary flight plan | |

| | | |
|--|--|-----|
| | | SPL |
|--|--|-----|

1.2 The standard types of field

The standard fields of data permitted in ATS messages are as shown in the following table. The numbers in column 1 correspond with those in the reference table on page A3-33.

| <i>Field type</i> | <i>Data</i> |
|-------------------|--|
| 3 | Message type, number and reference data |
| 5 | Description of emergency |
| 7 | Aircraft identification and SSR mode and code |
| 8 | Flight rules and type of flight |
| 9 | Number and type of aircraft and wake turbulence category |
| 10 | Equipment and capabilities |
| 13 | Departure aerodrome and time |
| 14 | Estimate data |
| 15 | Route |
| 16 | Destination aerodrome and total estimated elapsed time, destination alternate aerodrome(s) |
| 17 | Arrival aerodrome and time |
| 18 | Other information |
| 19 | Supplementary information |
| 20 | Alerting search and rescue information |
| 21 | Radio failure information |
| 22 | Amendment |

1.3 Composition of the standard types of message

The composition of each standard type of message, expressed as a standardized sequence of fields of data, shall be as prescribed in the reference table on page A3-33. Each message shall contain all the

fields prescribed.

1.4 Composition of the standard types of field

The composition of each standard type of field, expressed as a standardized sequence of elements of data, or in some cases as a simple element, shall be as prescribed in the field tables on pages A3-6 to A3-32.

Note.— Each type of field contains at least one mandatory element and, except in Field Type 9, this is the first or only element in the field. The rules for the inclusion or omission of conditional elements are indicated in the field tables.

1.5 Structuring and punctuation

- 1.5.1 The beginning of the ATS data shall be indicated on page copy by an open bracket ‘(’, which constitutes the Start-of-ATS-Data Signal. This signal shall be used only as the printed character immediately preceding the message type designator.

Note.— In teletypewriter operation using International Telegraph Alphabet No. 2, the open bracket is transmitted as the Figures Case of Signal No. 11. On some teletypewriter machines, this will print as a symbol other than ‘(’, but this variation will be local and of no consequence. Where higher level codes are employed, the character printing as ‘(’ is used.

- 1.5.2 The beginning of each field, other than the first, shall be indicated by a single hyphen ‘-’, which constitutes the Start-of-Field Signal. This signal shall be used only as the printed character preceding the first element of ATS data in each field.

Note.— In teletypewriter operation using International Telegraph Alphabet No. 2, the single hyphen is transmitted as the Figures Case of Signal No. 1. On some teletypewriter machines, this will print as a symbol other than ‘-’, but this variation will be local and of no consequence. Where higher level codes are employed, the character printing as ‘-’ is used.

- 1.5.3 Elements within a field shall be separated by an oblique stroke ‘/’ (see Note 1), or a space (sp.) (see Note 2) only where so prescribed in the field tables on pages A3-6 to A3-32.

Note 1.— In teletypewriter operation using International Telegraph Alphabet No. 2, the oblique stroke is transmitted as the Figures Case of Signal No. 24. On some teletypewriter machines, this will print as a symbol other than ‘/’, but this variation will be local and of no consequence. Where higher level codes are employed, the character printing as ‘/’ is used.

Note 2.— In teletypewriter operation using International Telegraph Alphabet No. 2, the space is transmitted as Signal No. 31. Where higher level codes are employed, the character which causes a space on page copy is to be used.

1.5.4 The end of the ATS data shall be indicated by a close bracket ‘)’, which constitutes the End-of-ATS-Data Signal. This signal shall be used only as the printed character immediately following the last field in the message.

Note.— In teletypewriter operation using International Telegraph Alphabet No. 2, the close bracket is transmitted as Signal No. 12. On some teletypewriter machines, this will print as a symbol other than ‘)’, but this variation will be local and of no consequence. Where higher level codes are employed, the character printing as ‘)’ is to be used.

1.5.5 When the standard ATS messages are prepared in teletypewriter form, an Alignment Function (two Carriage Returns followed by one Line Feed) shall be inserted:

- a) prior to each of the fields so annotated in the reference table on page A3-33;
- b) in Fields Type 5 (Description of emergency), 15 (Route), 18 (Other information), 19 (Supplementary information), 20 (Alerting search and rescue information), 21 (Radio failure information) and 22 (Amendment), whenever it is necessary to begin a new line on page copy (see Note). In such cases, the Alignment Function shall be inserted between two data elements and shall not divide an element.

Note.— Annex 10, Volume II, prescribes that a line of teletypewriter copy shall not contain more than 69 characters.

1.6 Data conventions

1.6.1 Most of the conventions to be used in the expression of ATS data in the messages are

prescribed in the field tables on pages A3-6 to A3-32, but the conventions for the expression of level, position and route data are given below to simplify the field tables.

1.6.2 *The expression of level data*

Four alternative conventions are available for the expression of level data:

- a) *“F” followed by 3 decimal numerics*: indicates a flight level number, i.e. Flight Level 330 is expressed as “F330”;
- b) *“S” followed by 4 decimal numerics*: indicates standard metric level in tens of metres, i.e. Standard Metric Level 11 300 metres (Flight Level 370) is expressed as “S1130”;
- c) *“A” followed by 3 decimal numerics*: indicates altitude in hundreds of feet, i.e. an altitude of 4 500 feet is expressed as “A045”;
- d) *“M” followed by 4 decimal numerics*: indicates altitude in tens of metres, i.e. an altitude of 8 400 metres is expressed as “M0840”.

1.6.3 *The expression of position or route*

The following alternative data conventions shall be used for the expression of position or route:

- a) from 2 to 7 characters, being the coded designator assigned to an ATS route to be flown;
- b) from 2 to 5 characters, being the coded designator assigned to an en-route point;
- c) 4 numerics describing latitude in degrees and tens and units of minutes, followed by “N” (meaning “North”) or “S” (South), followed by 5 numerics describing longitude in degrees and tens and units of minutes, followed by “E” (East) or “W” (West). The correct number of numerics is to be made up, where necessary, by the insertion of zeros, e.g. “4620N07805W”;
- d) 2 numerics describing latitude in degrees, followed by “N” (North) or “S” (South), followed by 3 numerics describing longitude in degrees, followed by “E” (East) or “W” (West). Again, the correct number of numerics is to be made up, where necessary, by the insertion of zeros, e.g. “46N078W”;

- e) 2 to 5 characters being the coded identification of a significant point, followed by 3 decimal numerics giving the bearing from the point in degrees magnetic followed by 3 decimal numerics giving the distance from the point in nautical miles. In areas of high latitude where it is determined by the appropriate authority that reference to degrees magnetic is impractical, degrees true may be used. The correct number of numerics is to be made up, where necessary, by the insertion of zeros, e.g. a point at 180° magnetic at a distance of 40 nautical miles from VOR “FOJ” would be expressed as “FOJ180040”.

1.7 The detail of the fields

- 1.7.1 The elements of data prescribed or permitted to be included in each type of field, together with a prescription of the conditions or options permitted, are shown on pages A3-6 to A3-32.
- 1.7.2 A key appears at the right-hand side of each of the field pages; this key permits the sequence of fields in each type of message to be followed.
- 1.7.3 The first field in each message type is Field Type 3; on the page describing Field Type 3 a key indicates the field type number of the next field for each message. On subsequent field pages, the field type number of the previous field is shown to permit back reference also. The Start-of-ATS-Data Signal ‘(’ is used in the key to indicate that there is no previous type of field; the End-of-ATS-Data Signal ‘)’ is used to indicate that there is no next type of field.
- 1.7.4 On the field pages,

elements with a fixed number of characters
are shown diagrammatically as (three
characters in this example)

elements of variable length are shown as

1.8 Accuracy in the preparation of ATS messages

Where the standard ATS messages are transmitted by teletypewriter channels in areas where ATC computers are known to be in use, the formats and data conventions prescribed in the field tables on pages A3-6 to A3-32 shall be adhered to rigorously.

Field Type 3 — Message type, number and reference data

FIELD TYPE 3

OPEN BRACKET

(a) *Message type designator*

3 LETTERS as follows:

| | |
|-----|-----------------------------------|
| ALR | Alerting |
| RCF | Radiocommunication failure |
| FPL | Filed flight plan |
| CHG | Modification |
| CNL | Cancellation |
| DLA | Delay |
| DEP | Departure |
| ARR | Arrival |
| CPL | Current flight plan |
| EST | Estimate |
| CDN | Coordination |
| ACP | Acceptance |
| LAM | Logical acknowledgement |
| RQP | Request flight plan |
| RQS | Request supplementary flight plan |
| SPL | Supplementary flight plan |

| <i>Previous type of field or symbol</i> | <i>This type of field is used in</i> | <i>Next type of field or symbol</i> |
|---|--------------------------------------|-------------------------------------|
| (| ALR | 5 |
| (| RCF | 7 |
| (| FPL | 7 |
| (| CHG | 7 |
| (| CNL | 7 |
| (| DLA | 7 |
| (| DEP | 7 |
| (| ARR | 7 |
| (| CPL | 7 |
| (| EST | 7 |
| (| CDN | 7 |
| (| ACP | 7 |
| (| LAM |) |
| (| RQP | 7 |
| (| RQS | 7 |
| (| SPL | 7 |

* Unless instructed otherwise, this field shall contain only the single element (a). Elements (b) or (b) and (c) are for use when messages are generated by, and/or exchanged between, the computer systems of ATS units.

(b) *Message number*

| | |
|--------------------|--|
| 1 to 4 LETTER(S) | identifying the sending ATS unit, followed by |
| OBLIQUE STROKE (/) | followed by |
| 1 to 4 LETTER(S) | identifying the receiving ATS unit, followed by |
| 3 DECIMAL NUMERICS | giving the serial number of this message in the sequence of messages transmitted by this unit to the indicated receiving ATS unit. |

(c) *Reference data*

1 to 4 LETTER(S) followed by OBLIQUE STROKE (/) followed by 1 to 4 LETTER(S) followed by 3 DECIMAL NUMERICS, giving the “message number” contained in element (b) of the operational message which began sequence of messages of which this message is a part.

Examples: (FPL
(CNL
(CHGA/B234A/B231
(CPLA/B002

Field Type 5 — Description of emergency

FIELD TYPE 5

Format:

| |
|--|
| |
|--|

 a /

| | | | | | | | | | |
|--|--|--|---|--|--|--|--|--|--|
| | | | | | | | | | |

|--|

 c

| <i>Previous type of field or symbol</i> | <i>This type of field is used in</i> | <i>Next type of field or symbol</i> |
|---|--------------------------------------|-------------------------------------|
| 3 | ALR | 7 |

SINGLE HYPHEN

(a) Phase of emergency

or INCERFA if an uncertainty phase, or
 ALERFA if an alert phase,
 DETRESFA if a distress phase

has been declared in respect of the aircraft concerned.

OBLIQUE STROKE

(b) Originator of message

8 LETTERS, being the 4-letter ICAO location indicator plus the 3-letter designator of the ATS unit originating the message followed by the letter X or, if applicable, the one-letter designator identifying the division of the ATS unit originating the message.

OBLIQUE STROKE

(c) Nature of emergency

SHORT PLAIN-LANGUAGE TEXT, as necessary to explain the nature of the emergency, with natural spaces between the words.

Example: -ALERFA/EINNZQZX/REPORT OVERDUE

Field Type 7 — Aircraft identification and SSR mode and code

* Format:

| |
|--|
| |
|--|

 /

| | | | | |
|---|--|---|--|--|
| b | | c | | |
|---|--|---|--|--|

SINGLE HYPHEN*(a) Aircraft identification*

NOT MORE THAN 7 CHARACTERS, being the aircraft identification shown in the filed flight plan and composed as specified in Appendix 2, Section 2.

* This field may be terminated here in messages relating to flights operating within areas where SSR is not used, or when the SSR code information is not known or would not be meaningful to the accepting unit.

OBLIQUE STROKE*(b) SSR mode*

LETTER A giving the SSR mode related to (c).

(c) SSR code

4 NUMERICS giving the SSR code assigned to the aircraft by ATS and transmitted in the mode given in (b).

Examples: -BAW902

-SAS912/A5100

FIELD TYPE 7

| <i>Previous type of field or symbol</i> | <i>This type of field is used in</i> | <i>Next type of field or symbol</i> |
|---|--|-------------------------------------|
| 5 3 | ALR RCF | 8 21 |

| 3 3 3 3 | CPL EST CDN ACP | 8 13 13 13 |
| 3 3 3 | RQP RQS SPL | 13 13 13 |

Field Type 8 — Flight rules and type of flight

*

Format:

| | |
|---|---|
| a | b |
|---|---|

SINGLE HYPHEN

(a) Flight rules

1 LETTER as follows:

- I if it is intended that the entire flight will be operated under the IFR V if it is intended that the entire flight will be operated under the VFR
- Y if the flight initially will be operated under the IFR, followed by one or more subsequent changes of flight rules
- Z if the flight initially will be operated under the VFR, followed by one or more subsequent changes of flight rules

Note.— If the letter Y or Z is used, the point or points at which a change of flight rules is planned is to be shown as indicated in Field Type 15.

FIELD TYPE 8

| <i>Previous type of field or symbol</i> | <i>This type of field is used in</i> | <i>Next type of field or symbol</i> |
|---|--------------------------------------|-------------------------------------|
| 7 | ALR | 9 |
| 7 | FPL | 9 |
| 7 | CPL | 9 |

* This field shall be terminated here unless indication of the type of flight is required by the appropriate ATS authority.

(b) Type of flight

1 LETTER as follows:

- S if scheduled air transport
- N if non-scheduled air transport G if general aviation
- M if military
- X other flights

Examples: -V

-IS

Field Type 9 — Number and type of aircraft and wake turbulence category

FIELD TYPE 9

Format:

| | | | | | | | |
|--|---|--|---|--|---|--|---|
| | a | | b | | / | | c |
|--|---|--|---|--|---|--|---|

SINGLE HYPHEN

(a) *Number of aircraft (if more than one)*

Note.— This element is included only in the case of formation flights.

1 OR 2 NUMERICS giving the number of aircraft in the flight.

| <i>Previous type of field or symbol</i> | <i>This type of field is used in</i> | <i>Next type of field or symbol</i> |
|---|--------------------------------------|-------------------------------------|
| 8 | ALR | 10 |
| 8 | FPL | 10 |
| 8 | CPL | 10 |

(b) *Type of aircraft*

2 to 4 CHARACTERS, being the appropriate designator chosen from ICAO Doc 8643, *Aircraft Type Designators*, or

ZZZZ if no designator has been assigned or if there is more than one type of aircraft in the flight.

Note.— If the letters ZZZZ are used, the type(s) of aircraft is (are) to be shown in the Other Information Field (see Field Type 18).

OBLIQUE STROKE

(c) *Wake turbulence category*

1 LETTER to indicate maximum certificated take-off mass of the aircraft:

J — Super
H — Heavy
M — Medium
L — Light

Examples: -DC3/M

-B707/M
-2FK27/M
-ZZZZ/L
-3ZZZZ/L
-B747/H

Field Type 10 — Equipment and capabilities

| | | | | |
|--------|--|--|--|--|
| (a) | Radiocommunication, navigation and approach aid equipment and capabilities | | | |
| | 1 LETTER as follows: | | | |
| N | no COM/NAV/approach aid equipment for the route to be flown is carried, or the equipment is unserviceable | | | |
| OR | S | Standard COM/NAV/approach aid equipment for the route to be flown is carried and serviceable (<i>see Note 1</i>) | | |
| AND/OR | ONE OR MORE OF THE FOLLOWING LETTERS to indicate the serviceable COM/NAV/approach aid equipment and capabilities | | | |
| A | GBAS landing system | J7 | CPDLC FANS 1/A SATCOM (Iridium) | |
| B | LPV (APV with SBAS) | | | |
| C | LORAN C | K | MLS | |
| D | DME | L | ILS | |
| E1 | FMC WPR ACARS | M1 | ATC SATVOICE (INMARSAT) | |
| E2 | D-FIS ACARS | M2 | ATC SATVOICE (MTSAT) | |
| E3 | PDC ACARS | M3 | ATC SATVOICE (Iridium) | |
| F | ADF | O | VOR | |
| G | GNSS. If any portion of the flight is planned to be conducted under IFR, it refers to GNSS receivers that comply with the requirements of Annex 10, Volume I (<i>See Note 2</i>) | P1 | CPDLC RCP 400 (<i>see Note 7</i>) | |
| | | P2 | CPDLC RCP 240 (<i>see Note 7</i>) | |
| | | P3 | SATVOICE RCP 400 (<i>see Note 7</i>) | |
| | | P4— | Reserved for RCP | |
| | | P9 | PBN approved (<i>see Note 4</i>) | |
| | | R | | |
| H | HF RTF | T | TACAN | |
| I | Inertial navigation | U | UHF RTF | |
| J1 | CPDLC ATN VDL Mode 2 (<i>see Note 3</i>) | V | VHF RTF | |
| | | W | RVSM approved | |

| | | | |
|----|--|---|--|
| J2 | CPDLC FANS 1/A HF DL | X | MNPS approved |
| J3 | CPDLC FANS 1/A VDL Mode A | Y | VHF with 8.33 kHz channel spacing capability |
| J4 | CPDLC FANS 1/A VDL Mode 2 | Z | Other equipment carried or other capabilities (<i>see Note 5</i>) |
| J5 | CPDLC FANS 1/A SATCOM (INMARSAT) | | |
| J6 | CPDLC FANS 1/A SATCOM (MTSAT) | | |

Note 7. Guidance material on the application of performance- based communication, which prescribes RCP to an air Traffic service in a specific area is contained in the Performance-based Communication and Surveillance (PBCS) Manual (Doc. 9869)

(b) Surveillance equipment and capabilities

Note 1.— The RSP specification(s), if applicable, will be listed in Item 18 following the indicator SUR/. Guidance material on the application of performance-based surveillance, which prescribes RSP to an air traffic service in a specific area, is contained in the Performance-based Communication and Surveillance (PBCS) Manual (Doc 9869).

Note 2.— Additional surveillance equipment or capabilities application should will be listed in Item 18 following the indicator SUR/, as required by the appropriate ATS authority

Field Type 18 — Other information

COM/ Indicate communications equipment and applications or capabilities not specified in Item 10 a).

DAT/ Indicate data communication equipment and applications or capabilities not specified in 10 a).

SUR/ Indicate Include surveillance equipment and capabilities not specified in Item 10 b). Indicate as many RSP specification(s) as apply to the flight, using designator(s) with no space. Multiple RSP specifications are separated by a space. Example: RSP180 RSP400.

Field Type 13 — Departure aerodrome and time

Format: -

| |
|---|
| * |
| a |
| b |

SINGLE HYPHEN

(a) *Departure aerodrome*

4 LETTERS, being

the ICAO four-letter location indicator allocated to the departure aerodrome, as specified in Doc 7910, *Location Indicators*, or

ZZZZ if no ICAO location indicator has been allocated (*see Note 1*) or if the departure aerodrome is not known, or

AFIL if the flight plan has been filed in the air (*see Note 2*).

Note 1.— If ZZZZ is used, the name and location of the departure aerodrome is to be shown in the Other Information Field (see Field Type 18) if this Field Type is contained in the message.

Note 2.— If AFIL is used, the ATS unit from which supplementary flight data can be obtained is to be shown in the Other Information Field (Field Type 18).

* This field shall be terminated here in message types CPL, EST, CDN and ACP. It shall be terminated here in message type RQP if the estimated off-block time is not known.

FIELD TYPE 13

| <i>Previous type of field or symbol</i> | <i>This type of field is used in</i> | <i>Next type of field or symbol</i> |
|---|--|---|
| 10 | ALR | 15 |
| 10777 | FPL CHG CNL DLA DEP ARR | 15 16 16 16 16 (16)* 17 |
| 1077 | CPL EST CDN ACP | 14 14 16 16 |
| 777 | RQP RQS SPL | 16 16 16 |

** Only in case of a diversionary landing

(b) *Time*

4 NUMERICS giving

the estimated off-block time (EOBT) at the aerodrome in (a) in FPL, ARR, CHG, CNL, DLA and RQS messages and in RQP message, if known, or

the actual time of departure from the aerodrome in (a) in ALR, DEP and SPL messages, or

the actual or estimated time of departure from the first point shown in the Route Field (see Field Type 15) in FPL messages derived from flight plans filed in the air, as shown by the letters AFIL in (a).

Examples: -EHAM0730

-AFIL1625

Field Type 14 — Estimate data

FIELD TYPE 14

Format:

| |
|--|
| |
|--|

 a

| |

 c

| |
|--|
| |
|--|

 d

| |
|---|
| e |
|---|

SINGLE HYPHEN

(a) *Boundary point (see Note 1)*

The BOUNDARY POINT expressed either by a designator consisting of 2 to 5 characters, in geographical coordinates, in abbreviated geographical coordinates, or by bearing and distance from a significant point.

Note 1.— This point may be an agreed point located close to, rather than on, the FIR boundary.

Note 2.— See 1.6 for data conventions.

| <i>Previous type of field or sym bol</i> | <i>This type of field is used in</i> | <i>Next type of field or sym bol</i> |
|--|--|--|
| 13 | CPL | 15 |
| 13 | EST | 16 |

OBLIQUE STROKE

(b) *Time at boundary point*

4 NUMERICS giving the estimated time at the boundary point.

(c) *Cleared level*

F followed by 3 NUMERICS, or

S followed by 4 NUMERICS, or

A followed by 3 NUMERICS, or

M followed by 4 NUMERICS

See data conventions
in 1.6 of this
Appendix.

giving the cleared level at which the aircraft will cross the boundary point, if in level cruising flight, or the cleared level to which it is proceeding, if climbing or descending at the boundary point.

* This field will be terminated here if the aircraft will cross the boundary point in level cruising flight.

*Field Type 14 (cont.)**(d) Supplementary crossing data*

A LEVEL, expressed as in (c), at or above which ^{the} or at or below which (see (e)) aircraft will cross the boundary point.

(e) Crossing condition

1 LETTER as follows:

A if the aircraft will cross the boundary point at or above the level in (d), or

B if the aircraft will cross the boundary point at or below the level in (d).

Examples: -LN/1746F160

-CLN/1831F240F180A

-5420N05000W/0417F290

-LNX/1205F160F200B

-ZD126028/0653F130

Field Type 15 — Route

FIELD TYPE

See Note in margin.

| <i>Previous type of field or symbol</i> | <i>This type of field is used in</i> | <i>Next type of field or symbol</i> |
|---|--------------------------------------|-------------------------------------|
| 13 | ALR | 16 |
| 13 | FPL | 16 |
| 14 | CPL | 16 |

SINGLE HYPHEN

(a) *Cruising speed or Mach number*

The true airspeed for the first or the whole cruising portion of the flight, in terms of:

K followed by 4 NUMERICS giving the true airspeed in kilometres per hour, or

N followed by 4 NUMERICS giving the true airspeed in knots, or

when so prescribed by the appropriate ATS authority, M followed by 3 NUMERICS giving the true Mach number to the nearest hundredth of unit Mach.

(b) *Requested cruising level*

F followed by 3 NUMERICS, or

S followed by 4 NUMERICS, or

A followed by 3 NUMERICS, or

M followed by 4 NUMERICS, or

VFR.

See data conventions in 1.6 of this Appendix.

SPACE

followed by a string of elements/groups of elements of the following seven types separated by SPACES, in whatever sequence is necessary to describe the route in an unambiguous manner (see Appendix 2, Section 2).

Note.— Further element groups of elements (c) should be added, as necessary, each to be preceded by a space.

*Field Type 15 (cont.)***(c1) Standard departure route**

The designator for the standard departure route from the aerodrome of departure to the first significant point on the defined route to be flown.

Note 1.— See data convention in 1.6.3 a) of this Appendix. Note 2.— Element

(c1) may be followed by (c3) or (c4).

Note 3.— Standard departure route need be included only where appropriate.

(c2) ATS route designator

Note 1.— See data convention in 1.6.3 a) of this Appendix. Note 2.—

Element (c2) may be followed by (c3) or (c4) only.

(c3) Significant point

Note.— See alternative data conventions in 1.6.3 b), c), d) and e) of Appendix.

this

(c4) Significant point/cruising speed and cruising level SIGNIFICANT

POINT (as in element (c3)) OBLIQUE STROKE

CRUISING SPEED OR MACH NUMBER (as in element (a))

REQUESTED CRUISING LEVEL (as in element (b)).

*Field Type 15 (cont.)***(c5) Indicator**

VFR if a change to VFR is to be made at the preceding point, or

IFR if a change to IFR is to be made at the preceding point, or

DCT if the flight to the next point will be outside a designated route, unless both points are defined by geographical coordinates or by bearing and distance.

T if the route description is truncated at the preceding point and the remainder is to be sought in a previously transmitted FPL or other data.

Note 1.— Element (c5) may follow (c3) or (c4) and (c6) only.

Note 2 — When used T must conclude the Route Field

(c6) Cruise climb

The letter C followed by an oblique stroke; then the point at which cruise climb is planned to start, expressed exactly as in (c3) above, followed by an oblique stroke; then the speed to be maintained during cruise climb expressed exactly as in (a) above followed by *the two levels* defining the layer to be occupied during cruise climb; each level expressed as in (b) above, or the level above which cruise climb is planned, followed by the letters PLUS, without a space between them.

(c7) Standard arrival route

The designator for the standard arrival route from the point of leaving the defined route to the point at which the approach procedure is initiated.

Note.— Standard arrival route need only be included where appropriate.

Field Type 16 — Destination aerodrome and total estimated elapsed time, destination alternate aerodrome(s)

FIELD TYPE 16

Format: -

See Note in margin
on page A3-21.

SINGLE HYPHEN

(a) *Destination aerodrome*

4 LETTERS, being

the ICAO four-letter location indicator allocated to the destination aerodrome, as specified in Doc 7910, *Location Indicators*, or

ZZZZ if no ICAO location indicator has been allocated.

Note.— If ZZZZ is used, the name and location of the destination aerodrome is to be shown in the Other Information Field (see Field Type 18).

- * This field is to be terminated here in all message types other than ALR, FPL and SPL.

| <i>Previous type of field or symbol</i> | <i>This type of field is used in</i> | <i>Next type of field or symbol</i> |

| 13 | SPL | 18 |

*** Only in case of a diversionary landing

(b) *Total estimated elapsed time*

4 NUMERICS, giving

the total estimated elapsed time.

- ** This field may be terminated here in FPL messages when so agreed between the ATS units concerned or prescribed on the basis of regional air navigation agreements.

Field Type 16 (cont.)

SPACE

(c) Destination alternate aerodrome(s)

4 LETTERS, being

the ICAO four-letter location indicator allocated to an alternate aerodrome, as specified in Doc 7910, *Location Indicators*, or

ZZZZ if no ICAO location indicator has been allocated.

Note.— If ZZZZ is used, the name and location of the destination alternate aerodrome is to be shown in the Other Information Field (see Field Type 18).

Note.— One further element of (c) should be added, as necessary, preceded by a space.

Examples: -EINN0630

-EHAM0645 EBBR

-EHAM0645 EBBR EDDL

| S2 | RNP APCH with BAR-VNAV |
| | |
| T1 | RNP AR APCH with RF (special authorization required) |
| T2 | RNP AR APCH without RF (special authorization required) |

Combinations of alphanumeric characters not indicated above are reserved.

NAV/ Significant data related to navigation equipment, other than specified in PBN/, as required by the appropriate ATS authority. Indicate GNSS augmentation under this indicator, with a space between two or more methods of augmentation, e.g. NAV/GBAS SBAS.

COM/ Indicate communications applications or capabilities not specified in Item 10 a).

DAT/ Indicate data applications or capabilities not specified in 10 a).

SUR/ Include surveillance applications or capabilities not specified in Item 10 b).

DEP/ Name and location of departure aerodrome, if ZZZZ is inserted in Item 13, or the ATS unit from which supplementary flight plan data can be obtained, if AFIL is inserted in Item 13. For With 4 figures describing latitude in degrees and tens and units of minutes followed by “N” (North) or “S” (South), followed by 5 figures describing longitude in degrees and tens and units of minutes, followed by “E” (East) or “W” (West). Make up the correct number of figures, where necessary, by insertion of zeros, e.g. 4620N07805W (11 characters).

OR/ Bearing and distance from the nearest significant point, as follows:
The identification of the significant point followed by the bearing from the point in the form of 3 figures giving degrees magnetic, followed by the distance from the point in the form of 3 figures expressing nautical miles. In areas of high latitude where it is determined by the appropriate authority that reference to degrees magnetic is impractical, degrees true may be used. Make up the correct number of figures, where necessary, by insertion of zeros, e.g. a point of 180° magnetic at a distance of 40 nautical miles from VOR “DUB” should be expressed as DUB180040.

OR The first point of the route (name or LAT/LONG) or the marker radio beacon, if the aircraft has not taken off from an aerodrome.

DEST/ Name and location of destination aerodrome, if ZZZZ is inserted in Item 16. For aerodromes not listed in the relevant Aeronautical Information Publication, indicate location in LAT/LONG or bearing and distance from the nearest significant point, as described under DEP/ above.

DOF/ The date of flight departure in a six-figure format (YYMMDD, where YY equals the year, MM equals the month and DD equals the day).

REG/ The nationality or common mark and registration mark of the aircraft, if different from the aircraft identification in Item 7.

EET/ Significant points or FIR boundary designators and accumulated estimated elapsed times from take-off to such points or FIR boundaries, when prescribed on the basis of regional air navigation agreements, or by appropriate ATS authority.

Examples: -EET/CAP0745 XYZ0830
-EET/EINN0204

Field Type 18 (cont.)

SEL/ SELCAL Code, for aircraft so equipped.

TYP/ Type(s) of aircraft preceded if necessary without a space by number(s) of aircraft and separated by one space if ZZZZ is inserted in Item 9.

Example: -TYP/2F15 5F5 3B2

CODE/ Aircraft address (expressed in the form of an alphanumerical code of six hexadecimal characters) when required by the appropriate ATS authority. Example: “F00001” is the lowest aircraft address contained in the specific block administered by ICAO.

DLE/ En-route delay or holding, insert the significant point(s) on the route where a delay is planned to occur, followed by the length of delay using four-figure time in hours and minutes (hhmm).

Example: -DLE/MDG0030

OPR/ ICAO designator or name of the aircraft operating agency, if different from the aircraft identification in item 7.

ORGN/ The originator’s eight-letter AFTN address or other appropriate contact details, in cases where the originator of the flight plan may not be readily identified, as required by the appropriate ATS authority.

Note.— In some areas, flight plan reception centres may insert the ORGN/ identifier and originator’s AFTN address automatically.

PER/ Aircraft performance data, indicated by a single letter as specified in the *Procedures for Air Navigation Services — Aircraft Operations* (PANS-OPS, Doc 8168), Volume I — *Flight Procedures*, if so prescribed by the appropriate ATS authority.

ALTN/ Name of destination alternate aerodrome(s), if ZZZZ is inserted in Item 16. For aerodromes not listed in the relevant Aeronautical Information Publication, indicate location in LAT/LONG or bearing and distance from the nearest significant point, as described in DEP/ above.

RALT/ ICAO four-letter indicator(s) for en-route alternate(s), as specified in Doc 7910, *Location Indicators*, or name(s) of en-route alternate aerodrome(s), if no indicator is allocated. For aerodromes not listed in the relevant Aeronautical Information Publication, indicate location in LAT/LONG or bearing and distance from the nearest significant point, as described in DEP/ above.

TALT/ ICAO four-letter indicator(s) for take-off alternate, as specified in Doc 7910, *Location Indicators*, or name of take-off alternate aerodrome, if no indicator is allocated. For aerodromes not listed in the relevant Aeronautical Information Publication, indicate location in LAT/LONG or bearing and distance from the nearest significant point, as described in DEP/ above.

RIF/ The route details to the revised destination aerodrome, followed by the ICAO four-letter location indicator of the aerodrome. The revised route is subject to reclearance in flight.

Examples: -RIF/DTA HEC KLAX
-RIF/ESP G94 CLA YPPH

RMK/ Any other plain-language remarks when required by the appropriate ATS authority or deemed necessary, by the pilot-in-command for the provision of air traffic services.

Examples: -0
-STS/MEDEVAC
-EET/015W0315 020W0337 030W0420 040W0502

Field Type 19 — Supplementary information

Format: - [] [(sp)] (sp) * [(sp)]
 (* additional elements as necessary)

This field consists of such supplementary information as is available, organized into a string of elements separated by spaces.

The permissible elements in their proper sequence are:

SINGLE HYPHEN

FIELD TYPE 19

| <i>Previous type of field or symbol</i> | <i>This type of field is used in</i> | <i>Next type of field or symbol</i> |
|---|--------------------------------------|-------------------------------------|
| 18 | AL R | 20 |
| 18 | SPL |) |

(a) E/ followed by 4 NUMERICS giving the fuel endurance in hours and minutes.

(b) P/ followed by 1, 2 or 3 NUMERICS giving the total number of persons on board, when so prescribed by the appropriate ATS authority.

(c) R/ followed by one or more of the following, without spaces:

U if frequency 243.0 MHz (UHF) is available,
 V if frequency 121.5 MHz (VHF) is available,
 E if emergency locator transmitter (ELT) is available.

(d) S/ followed by one or more of the following, without spaces:

P if polar survival equipment is carried,
 D if desert survival equipment is carried,
 M if maritime survival equipment is carried,
 J if jungle survival equipment is carried.

(e) J/ followed by one or more of the following, without spaces:

L if the life jackets are equipped with lights,
 F if they are equipped with fluorescein, followed by space followed by U if any life jacket radio is equipped with UHF on frequency 243.0 MHz,
 V if any life jacket radio is equipped with VHF on frequency 121.5 MHz.

Field Type 19 (cont.)

- | | | |
|-----|----|---|
| (f) | D/ | followed by one or more of the following, separated by spaces: 2 NUMERICS giving the number of dinghies carried, C if 3 NUMERICS giving the total capacity, in persons carried, of all dinghies. dinghies are covered. The colour of the dinghies (e.g. RED). |
| (g) | A/ | followed by one or more of the following, separated by spaces: The colour of the aircraft. Significant markings (this may include the aircraft registration). |
| (h) | N/ | followed by plain language indicating any other survival equipment carried and any other useful remarks. |
| (i) | C/ | followed by the name of the pilot-in-command. |

Example: -E/0745 P/6 R/VE S/M J/L D/2 8 C YELLOW

A/YELLOW RED TAIL N145E C/SMITH

Field Type 20 — Alerting search and rescue information

Format: - [] (sp) [] (sp) * [(sp)]
 (* EIGHT elements in all)

This field consists of the following specified sequence of elements separated by spaces.

FIELD TYPE 20

| <i>Previous type of field or symbol</i> | <i>This type of field is used in</i> | <i>Next type of field or symbol</i> |
|---|--------------------------------------|-------------------------------------|
| 19 | ALR |) |

SINGLE HYPHEN

(a) *Identity of operator*

The ICAO two-letter designator of the aircraft operating agency or, if this has not been assigned, the name of the operator.

(b) *Unit which made last contact*

6 LETTERS consisting of the 4-letter ICAO location indicator followed by the 2-letter designator which together identify the ATS unit which made the last two-way contact or, if these are not available, some other description of the unit.

(c) *Time of last two-way contact*

4 NUMERICS giving the time of the last two-way contact.

(d) *Frequency of last contact*

NUMERICS as necessary giving the transmitting/receiving frequency of the last contact.

(e) *Last reported position*

The last reported position expressed in one of the data conventions of 1.6 of this Appendix followed by the time over that position.

Field Type 20 (cont.)

| |
|--|
| (f) <i>Method of determining last known position</i> |
|--|

| |
|-----------------------------------|
| Plain-language text as necessary. |
|-----------------------------------|

| |
|---|
| (g) <i>Action taken by reporting unit</i> |
|---|

| |
|-----------------------------------|
| Plain-language text as necessary. |
|-----------------------------------|

| |
|--|
| (h) <i>Other pertinent information</i> |
|--|

| |
|-----------------------------------|
| Plain-language text as necessary. |
|-----------------------------------|

Example: -USAF LGGGZAZX 1022 126.7 GN 1022
PILOT REPORT OVER NDB ATS UNITS
ATHENS FIR ALERTED NIL

Field Type 21 — Radio failure information

Format: - [] (sp) [] (sp) * (sp) []
 (* SIX elements in all)

This field consists of the following specified sequence of elements preceded by a single hyphen and separated by spaces. Any information not available is to be shown as “NIL” or “NOT KNOWN” and not simply omitted.

FIELD TYPE 21

| <i>Previous type of field or symbol</i> | <i>This type of field is used in</i> | <i>Next type of field or symbol</i> |
|---|--------------------------------------|-------------------------------------|
| 7 | RCF |) |

SINGLE HYPHEN

(a) *Time of last two-way contact*

4 NUMERICS giving the time of the last two-way contact with the aircraft.

(b) *Frequency of last contact*

NUMERICS as necessary giving the transmitting/receiving frequency of the last two-way contact with the aircraft.

(c) *Last reported position*

The last reported position expressed in one of the data conventions of 1.6 of this Appendix.

(d) *Time at last reported position*

4 NUMERICS giving the time at the last reported position.

(e) *Remaining COM capability*

LETTERS as necessary identifying the remaining COM capability of the aircraft, if known, using the convention of Field Type 10, or in plain language.

(f) *Any necessary remarks*

Plain-language text as necessary.

Example: -1232 121.3 CLA 1229 TRANSMITTING ONLY
 126.7 LAST POSITION CONFIRMED BY RADAR

*Field Type 22 — Amendment*Format: -

| | |
|---|--|
| a | |
|---|--|

 /

| | |
|---|--|
| b | |
|---|--|

SINGLE HYPHEN

(a) *Field indicator*

ONE OR TWO NUMERICS giving the type number of the field to be amended.

OBLIQUE STROKE

(b) *Amended data*

The complete and amended data of the field indicated in (a), constructed as specified for that field.

FIELD TYPE 22

| <i>Previous type of field or symbol</i> | <i>This type of field is used in</i> | <i>Next type of field or symbol</i> |
|---|--------------------------------------|-------------------------------------|
| 18 | CHG | *22 or) |
| 16 | CDN | *22 or) |

* Indicates that further fields of this type may be added

Example of amendment of Field Type 8 (Flight rules and type of flight) to IN:

-8/IN

Example of amendment of Field Type 14 (Estimate data):

-14/ENO/0145F290A090A

Example of amendment of Fields Type 8 (Flight rules and type of flight) and 14 (Estimate data):

-8/I-14/ENO/0148F290A110A

STANDARD ATS MESSAGES AND THEIR COMPOSITION

○ This field begins a new line when the message is printed in page teletypewriter form.

△ This field is repeated as necessary.

RULES FOR THE COMPOSITION OF ATS MESSAGES

(See Sections 1.3 to 1.8 of this Appendix)

Composition of the standard types of message

The composition of each standard type of message, expressed as a standardized sequence of fields of data, shall be as prescribed in the reference table on this page. Each message shall contain all the fields prescribed.

Composition of the standard types of field

The composition of each standard type of field, expressed as a standardized sequence of elements of data, or in some cases as a simple element, shall be as prescribed in the field tables on pages A3-6 to A3-34.

Note.— Each type of field contains at least one mandatory element and, except in Field Type 9, this is the first or only element in the field. The rules for the inclusion or omission of conditional elements are indicated in the field tables.

Structuring and punctuation

The beginning of the ATS data shall be indicated on page copy by an open bracket '[', which constitutes the Start-of-ATS-Data Signal. This signal shall be used only as the printed character immediately preceding the message type designator.

Note.— In teletypewriter operation using International Telegraph Alphabet No. 2, the open bracket is transmitted as the Figures Case of Signal No. 11. On some teletypewriter machines, this will print as a symbol other than '[', but this variation will be local and of no consequence. Where higher level codes are employed, the character printing as '[' is used.

The beginning of each field, other than the first, shall be indicated by a single hyphen '-', which constitutes the Start-of-Field Signal. This signal shall be used only as the printed character preceding the first element of ATS data in each field.

Note.— In teletypewriter operation using International Telegraph Alphabet No. 2, the single hyphen is transmitted as the Figures Case of Signal No. 1. On some teletypewriter machines, this will print as a symbol other than '-', but this variation will be local and of no consequence. Where higher level codes are employed, the character printing as '-' is used.

Elements within a field shall be separated by an oblique stroke '/' (see Note 1), or a space (sp.) (see Note 2) only where so prescribed in the field tables on pages A3-6 to A3-34.

Note 1.— In teletypewriter operation using International Telegraph Alphabet No. 2, the oblique stroke is transmitted as the Figures Case of Signal No. 24. On some teletypewriter machines, this will print as a symbol other than '/', but this variation will be local and of no consequence. Where higher level codes are employed, the character printing as '/' is used.

Note 2.— In teletypewriter operation using International Telegraph Alphabet No. 2, the space is transmitted as Signal No. 31. Where higher level codes are employed, the character which causes a space on page copy is to be used.

The end of the ATS data shall be indicated by a close bracket ']', which constitutes the End-of-ATS-Data Signal. This signal shall be used only as the printed character immediately following the last field in the message.

Note.— In teletypewriter operation using International Telegraph Alphabet No. 2, the close bracket is transmitted as Signal No. 12. On some teletypewriter machines, this will print as a symbol other than ']', but this variation will be local and of no consequence. Where higher level codes are employed, the character printing as ']' is to be used.

When the standard ATS messages are prepared in teletypewriter form, an Alignment Function (two Carriage Returns followed by one Line Feed) shall be inserted:

- (a) prior to each of the fields so annotated in the reference table on this page;
- (b) in Fields Type 5 (Description of emergency), 15 (Route), 18 (Other information), 19 (Supplementary information), 20 (Alerting search and rescue information), 21 (Radio failure information) and 22 (Amendment), whenever it is necessary to begin a new line on page copy (see Note). In such cases, the Alignment Function shall be inserted between two data elements and shall not divide an element.

Note.— Annex 10, Volume II, prescribes that a line of teletypewriter copy shall not contain more than 69 characters.

Data conventions

Most of the conventions to be used in the expression of ATS data in the messages are prescribed in the field tables on pages A3-6 to A3-34, but the conventions for the expression of level, position and route data are given below.

The expression of level data

Four alternative conventions are available for the expression of level data:

- (a) "F" followed by 3 decimal numerics: indicates a flight level number, i.e. Flight Level 340 is expressed as "F340";
- (b) "S" followed by 4 decimal numerics: indicates standard metric level in tens of metres, i.e. Standard Metric Level 11 300 m (Flight Level 370) is expressed as "S1130";
- (c) "A" followed by 3 decimal numerics: indicates altitude in hundreds of feet, i.e. an altitude of 4 500 feet is expressed as "A045";
- (d) "M" followed by 4 decimal numerics: indicates altitude in tens of metres, i.e. an altitude of 8 400 metres is expressed as "M0840".

The expression of position or route

The following alternative data conventions shall be used for the expression of position or route:

- (a) from 2 to 7 characters, being the coded designator assigned to an ATS route to be flown;

- (b) from 2 to 5 characters, being the coded designator assigned to an en-route point;

- (c) 4 numerics describing latitude in degrees and tens and units of minutes, followed by "N" (meaning "North") or "S" (South), followed by 5 numerics describing longitude in degrees and tens and units of minutes, followed by "E" (East) or "W" (West). The correct number of numerics is to be made up, where necessary, by the insertion of zeros, e.g. "4620N07805W";

- (d) 2 numerics describing latitude in degrees, followed by "N" (North) or "S" (South), followed by 3 numerics describing longitude in degrees, followed by "E" (East) or "W" (West). Again, the correct number of numerics is to be made up, where necessary, by the insertion of zeros, e.g. "46N078W";

- (e) 2 to 5 characters being the coded identification of a significant point, followed by 3 decimal numerics giving the bearing from the point in degrees magnetic followed by 3 decimal numerics giving the distance from the point in nautical miles. In areas of high latitude where it is determined by the appropriate authority that reference to degrees magnetic is impractical, degrees true may be used. The correct number of numerics is to be made up, where necessary, by the insertion of zeros, e.g. a point at 180° magnetic at a distance of 40 nautical miles from VOR "FOJ" would be expressed as "FOJ180040".

The detail of the fields

The elements of data prescribed or permitted to be included in each type of field, together with a prescription of the conditions or options permitted, are shown on pages A3-6 to A3-34.

A key appears at the right-hand side of each of the field pages; this key permits the sequence of fields in each type of message to be followed.

The first field in each message type is Field Type 3; on the page describing Field Type 3 a key indicates the field type number of the next field for each message. On subsequent field pages, the field type number of the previous field is shown to permit back reference also. The Start-of-ATS-Data Signal '[' is used in the key to indicate that there is no previous type of field; the End-of-ATS-Data Signal ']' is used to indicate that there is no next type of field.

On the field pages,

elements with a fixed number of characters are shown diagrammatically as

elements of variable length are shown as

Accuracy in the preparation of ATS messages

Where the standard ATS messages are transmitted by teletypewriter channels in areas where ATC computers are known to be in use, the formats and data conventions prescribed in the field tables on pages A3-6 to A3-34 shall be adhered to rigorously.

1. Examples of ATS messages

1.1. Table of contents

| <i>Message category</i> | <i>Message type</i> | <i>Message type designator</i> | <i>Paragraph</i> |
|---|-----------------------------------|------------------------------------|------------------|
| Emergency | Alerting | ALR | 2.2.1 |
| | Radiocommunication failure | RCF | 2.2.2 |
| Filed flight plan and associated update | Filed flight plan | FPL | 2.3.1 |
| | Modification | CHG | 2.3.2 |
| | Cancellation | CNL | 2.3.3 |
| | Delay | DLA | 2.3.4 |
| | Departure | DEP | 2.3.5 |
| | Arrival | ARR | 2.3.6 |
| Coordination | Current flight plan | CPL | 2.4.1 |
| | Estimate | EST | 2.4.2 |
| | Coordination | CDN | 2.4.3 |
| | Acceptance | ACP | 2.4.4 |
| | Logical acknowledgement | LAM | 2.4.5 |
| Supplementary | Request flight plan | RQP | 2.5.1 |
| | Request supplementary flight plan | RQS | 2.5.2 |
| | Supplementary flight plan | SPL | 2.5.3 |

Note 1.— Only the ATS information, i.e. in AFTN messages only the AFTN text, is shown.

Note 2.— The numbers in the composition diagrams correspond to the field type numbers used in Section 1 of this Appendix.

1.2. Emergency messages

1.2.1. Alerting (ALR) message

1.2.1.1. *Composition*

| | | | |
|---|---|---|---|
| (| 3 Message type, number and reference data | - | 5 Description of emergency |
| - | 7 Aircraft identification and SSR mode and | - | 8 Flight rules and type of flight |
| - | 9 Type of aircraft and wake turbulence | - | 10 Equipment and capabilities |
| | 13 Departure aerodrome and time | | |
| - | 15 Route (using more than one line if necessary) | | |
| | | | |
| | 16 Destination aerodrome and total estimated elapsed time, destination alternate aerodrome(s) | | |
| - | 18 Other information (using more than one line if necessary) | | |
| | | | |
| - | 19 Supplementary information (using more than one line if necessary) | | |
| | | | |

| | |
|----|--|
| | |
| 20 | |
| - | Alerting search and rescue information (using more than one line if necessary) |
| |) |

1.2.1.2. Example

The following is an example of an alerting message relating to an uncertainty phase, sent by Athens Approach Control to Belgrade Centre and other ATS units, in respect of a flight from Athens to Munich.

(ALR-INCERFA/LGGGZAZX/OVERDUE

-FOX236/A3624-IM

-C141/H-S/C

-LGAT1020

-N0430F220 B9 3910N02230W/N0415F240 B9 IVA/N0415F180 B9

-EDDM0227 EDDF

-REG/A43213 EET/LYBE0020 EDMIO133 OPR/USAF RMK/NO POSITION REPORT
SINCE DEP PLUS 2 MINUTES

-E/0720 P/12 R/UV J/LF D/02 014 C ORANGE A/SILVER C/SIGGAH

-USAF LGGGZAZX 1022 126.7 GN 1022 PILOT REPORT OVER NDB ATS UNITS
ATHENS FIR ALERTED NIL)

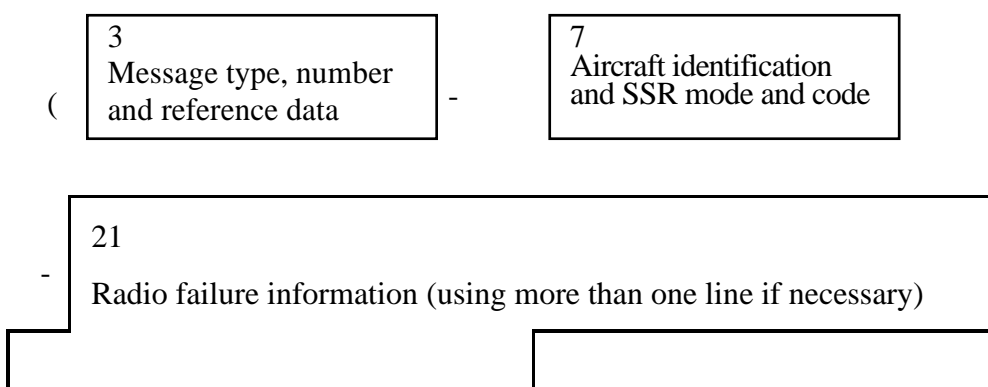

1.2.1.2.1. Meaning

Alerting message — uncertainty phase declared by Athens due no position reports and no radio contact since two minutes after departure — aircraft identification FOX236 — IFR, military flight — Starlifter, heavy wake turbulence category, equipped with standard communications, navigation and approach aid equipment for the route, SSR transponder with Modes A (4 096 code capability) and C — last assigned Code 3624 — departed Athens 1020 UTC — cruising speed for first portion of route 430 knots, first requested

cruising level FL 220 — proceeding on airway Blue 9 to 3910N2230W where TAS would be changed to 415 knots and FL240 would be requested — proceeding on airway Blue 9 to Ivanic Grad VOR where FL 180 would be requested, maintaining TAS of 415 knots and FL240 would be requested — proceeding on airway Blue 9 to Munich, total estimated elapsed time 2 hours and 27 minutes — destination alternate is Frankfurt — aircraft registration A43213 — accumulated estimated elapsed times at the Belgrade and Munich FIR boundaries 20 minutes and 1 hour and 33 minutes respectively — the aircraft is operated by the USAF — no position report has been received since 2 minutes after departure — endurance 7 hours and 20 minutes after take-off — 12 persons on board — portable radio equipment working on VHF 121.5 MHz and UHF 243 MHz is carried — life jackets fitted with lights and fluorescein are carried — 2 dinghies with orange covers are carried, have a total capacity for 14 persons — aircraft colour is silver — pilot's name is SIGGAH — operator is USAF — Athens approach control was the last unit to make contact at 1022 UTC on 126.7 MHz when pilot reported over GN runway locator beacon — Athens approach control have alerted all ATS units within Athens FIR — no other pertinent information.

1.2.2. Radiocommunication failure (RCF) message

1.2.2.1. Composition

1.2.2.2. Example

The following is an example of a message sent from London to Amsterdam informing that centre of a radiocommunication failure on a flight that has been cleared to it. The related flight

plan shows that the aircraft is not equipped with an SSR transponder.

(RCF-GAGAB

-1231 121.3 CLA 1229 TRANSMITTING ONLY 126.7 MHZ LAST POSITION
CONFIRMED BY RADAR)

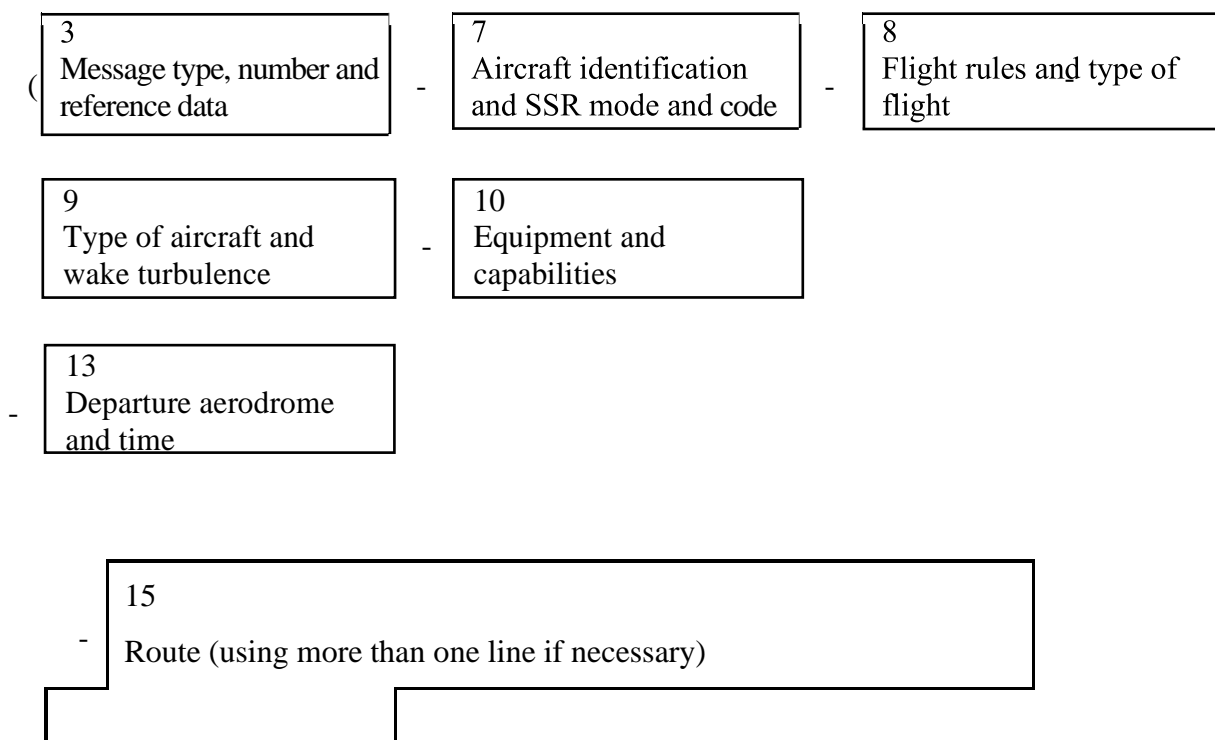

1.2.2.2.1. *Meaning*

Radiocommunication failure message — aircraft identification GAGAB — no SSR code assigned — last communication with London Centre 1232 UTC on 121.3 MHz — last reported position was Clacton VOR, at 1229 UTC — remaining COM capability: last heard transmitting on 126.7 MHz — position report at Clacton observed by radar.

1.3. Filed flight plan and associated update messages

1.3.1. *Filed flight plan (FPL) message*

2.3.1.1 *Composition*

| | | |
|---|----|--|
| - | 16 | Destination aerodrome and total estimated elapsed time, destination alternate aerodrome(s) |
| - | 18 | Other information (using more than one line if necessary) |
| | |) |

2.3.1.1 Example

The following is an example of a filed flight plan message sent by London Airport to Shannon, Shanwick and Gander Centres. The message may also be sent to the London Centre or the data may be passed to that centre by voice.

FPL-ACA101-IS

-B773/H-CHOV/C

-EGLL1400

1.3.1.1.1. Meaning

Filed flight plan message — aircraft identification ACA101 — IFR, scheduled flight — a Boeing 777-300, heavy wake turbulence category equipped with Loran C, HF RTF, VOR, VHF RTF and SSR transponder with Modes A (4 096 code capability) and C — departure aerodrome is London, estimated off-block time 1400 UTC — cruising speed and requested flight level for the first portion of the route are 450 knots and FL 310 — the flight will proceed on Airways Lima 9 and Upper Lima 9 to a point bearing 285 degrees magnetic and 36 NM from the Strumble VOR. From this point the flight will fly at a constant Mach number of .82, proceeding on Upper Lima 9 to LIMRI; then to 52N20W; to 52N30W; to 50N40W; to 49N50W; to destination Gander, total estimated elapsed time 4 hours and 55 minutes

— destination alternate is Goose Bay — captain has notified accumulated estimated elapsed times at significant points along the route, they are at the Shannon FIR boundary 26 minutes, at the Shanwick Oceanic FIR boundary 1 hour and 11 minutes, at 20W 1 hour and 36 minutes, at the Gander Oceanic FIR boundary 2 hours and 28 minutes, at 40W 3 hours and 30 minutes and at 50W 4 hours and 15 minutes — SELCAL code is FJEL.

2.3.1 *Modification (CHG) message*

2.3.1.1 *Composition*

2.3.1.2 *Example*

The following is an example of a modification message sent by Amsterdam Centre to Frankfurt Centre correcting information previously sent to Frankfurt in a filed flight plan message. It is assumed that both centres are computer-equipped.

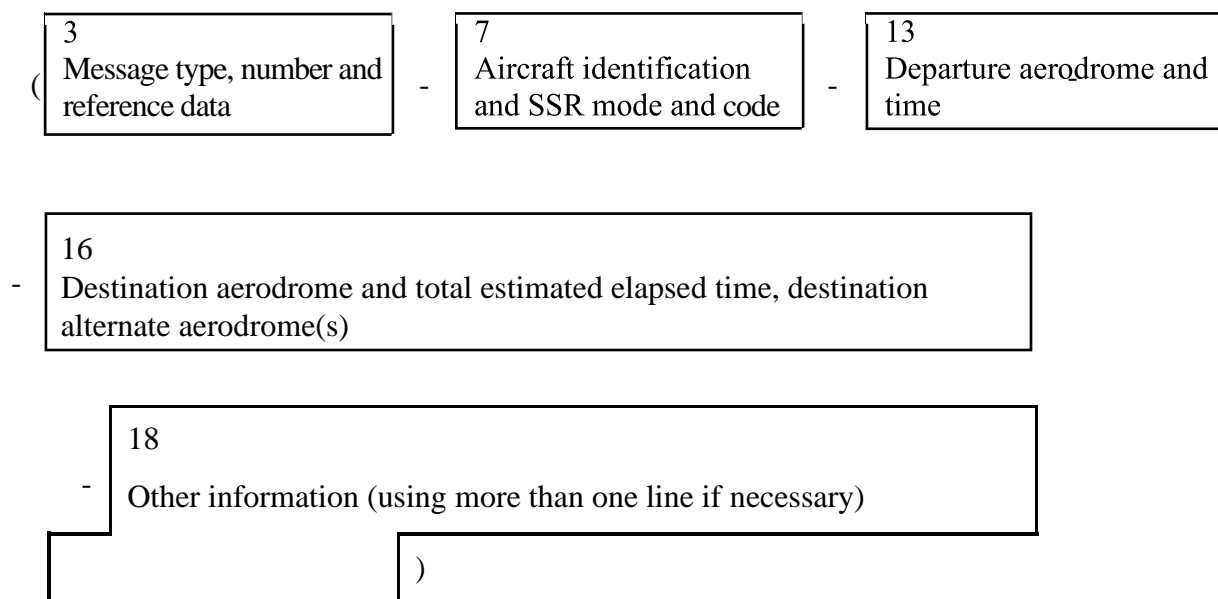

(CHGA/F016A/F014-GABWE/A2173-EHAM0850-EDDF-DOF/080122-8/I-16/EDDN)

1.3.1.1.2. *Meaning*

Modification message - Amsterdam and Frankfurt computer unit identifiers A and F, followed by serial number (016) of this message sent by Amsterdam, repeat of computer unit identifiers followed by serial number (014) of the related filed flight plan message aircraft identification GABWE, SSR Code 2173 operating in Mode A, en route from Amsterdam EOBT0850 to Frankfurt date of flight 22 Jan 2008 - Field Type 8 of the related filed flight plan message is corrected to IFR - Field Type 16 of the related filed flight plan is corrected, the new destination is Nurnberg.

2.3.2 *Flight plan cancellation (CNL) message*

2.3.2.1 *Composition*

2.3.1.1 *Example 1*

The following is an example of a flight plan cancellation message sent by an ATS unit to all addressees of a filed flight plan message previously sent by that unit.

(CNL-DLH522-EDBB0900-LFPO-0)

2.3.1.1.1 *Meaning*

Flight plan cancellation message — cancel the flight plan of aircraft identification DLH522 — flight planned from Berlin EOBT0900 to Paris — no other information.

2.3.1.2 Example 2

The following is an example of a flight plan cancellation message sent by a centre to an adjacent centre. It is assumed that both centres are equipped with ATC computers.

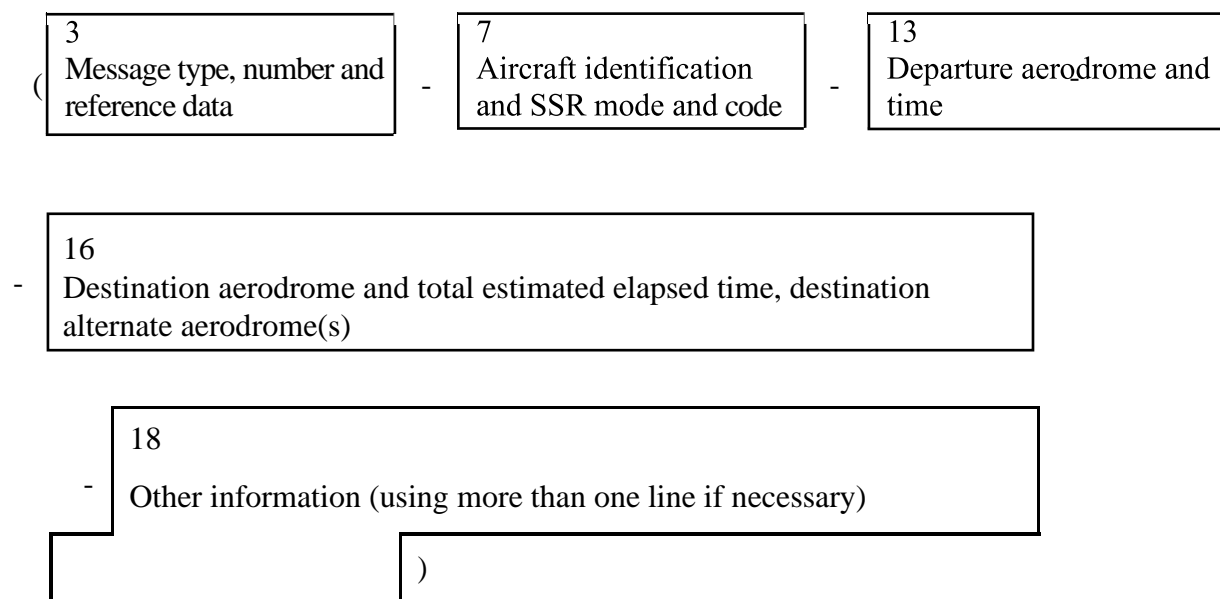

(CNLF/B127F/B055-BAW580-EDDF1430-EDDW-0)

2.3.2.1.1 Meaning

Flight plan cancellation message — identifiers of sending and receiving ATC computer units F and B, followed by serial number (127) of this message, repeat of computer unit identifiers followed by serial number (055) of current flight plan message previously transmitted — cancel the flight plan of aircraft identification BAW580 — flight planned from Frankfurt EOBT1430 to Bremen - no other information.

2.3.3 Delay (DLA) message

2.3.3.1 Composition

2.3.3.2 Example

The following is an example of a delay message sent from a departure aerodrome, or from a parent unit handling communications for a departure aerodrome, to each addressee of a filed flight plan message.

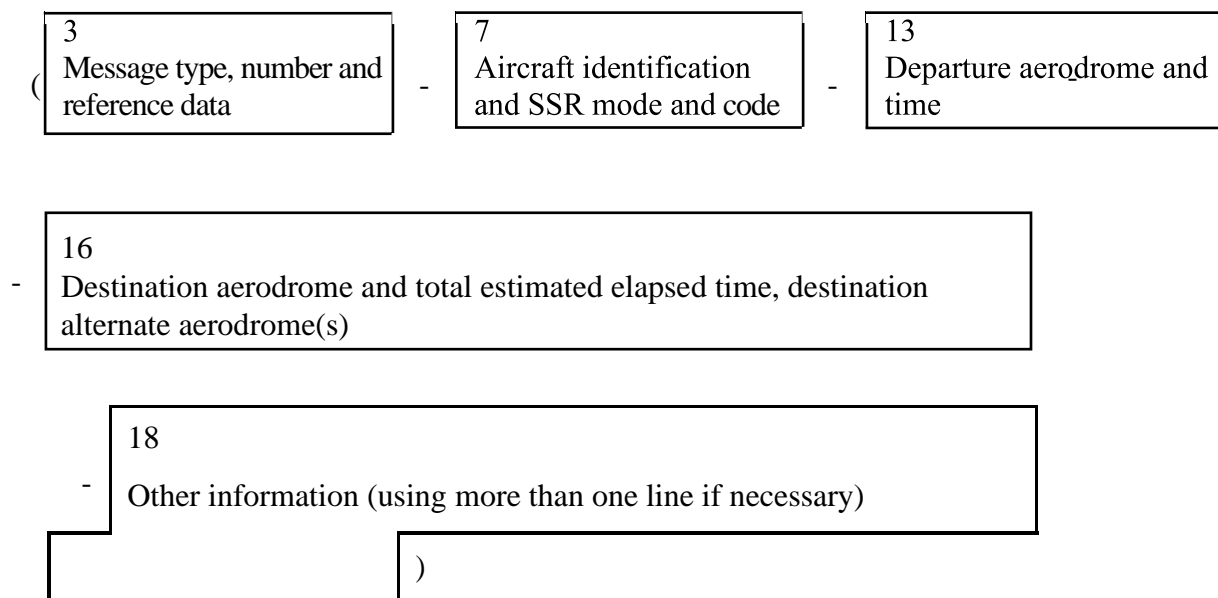

(DLA-KLM671-LIRF0900-LYDU-0)

2.3.3.2.1 Meaning

Delay message — aircraft identification KLM671 — revised estimated off-block time Fiumicino 0900 UTC destination Dubrovnik — no other information.

2.3.4 Departure (DEP) message

2.3.4.1 Composition

2.3.4.2 Example

The following is an example of a departure message sent from a departure aerodrome, or from a parent unit handling communications for a departure aerodrome, to each addressee of a filed flight plan message.

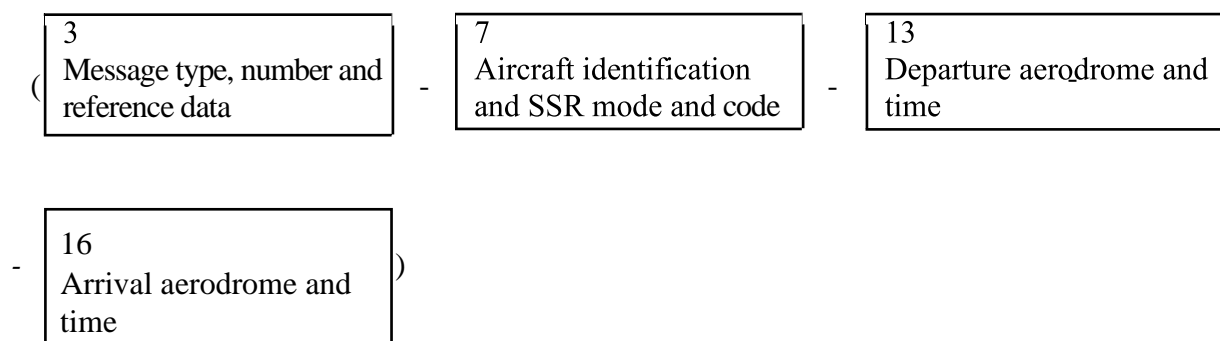

(DEP-CSA4311-EGPD1923-ENZV-0)

2.3.4.2.1 *Meaning*

Departure message — aircraft identification CSA4311 — departed from Aberdeen at 1923 UTC — destination Stavanger - no other information.

2.3.5 *Arrival (ARR) message*

2.3.5.1 *Composition*

2.3.5.2 *Example 1*

The following is an example of an arrival message sent from the arrival aerodrome (= destination) to the departure aerodrome.

(ARR-CSA406-LHBP0800-LKPR0913)

2.3.5.2.1 *Meaning*

Arrival message — aircraft identification CSA406 — departed from Budapest/Ferihegy at 0800 — landed at Prague/Ruzyne Airport at 0913 UTC.

2.3.5.3 *Example 2*

The following is an example of an arrival message sent for an aircraft which has landed at an aerodrome for which no ICAO location indicator has been allocated. The SSR code would not be meaningful.

(ARR-HHE13-EHAM0900 - EDDD - ZZZZ1030 DEN HELDER)

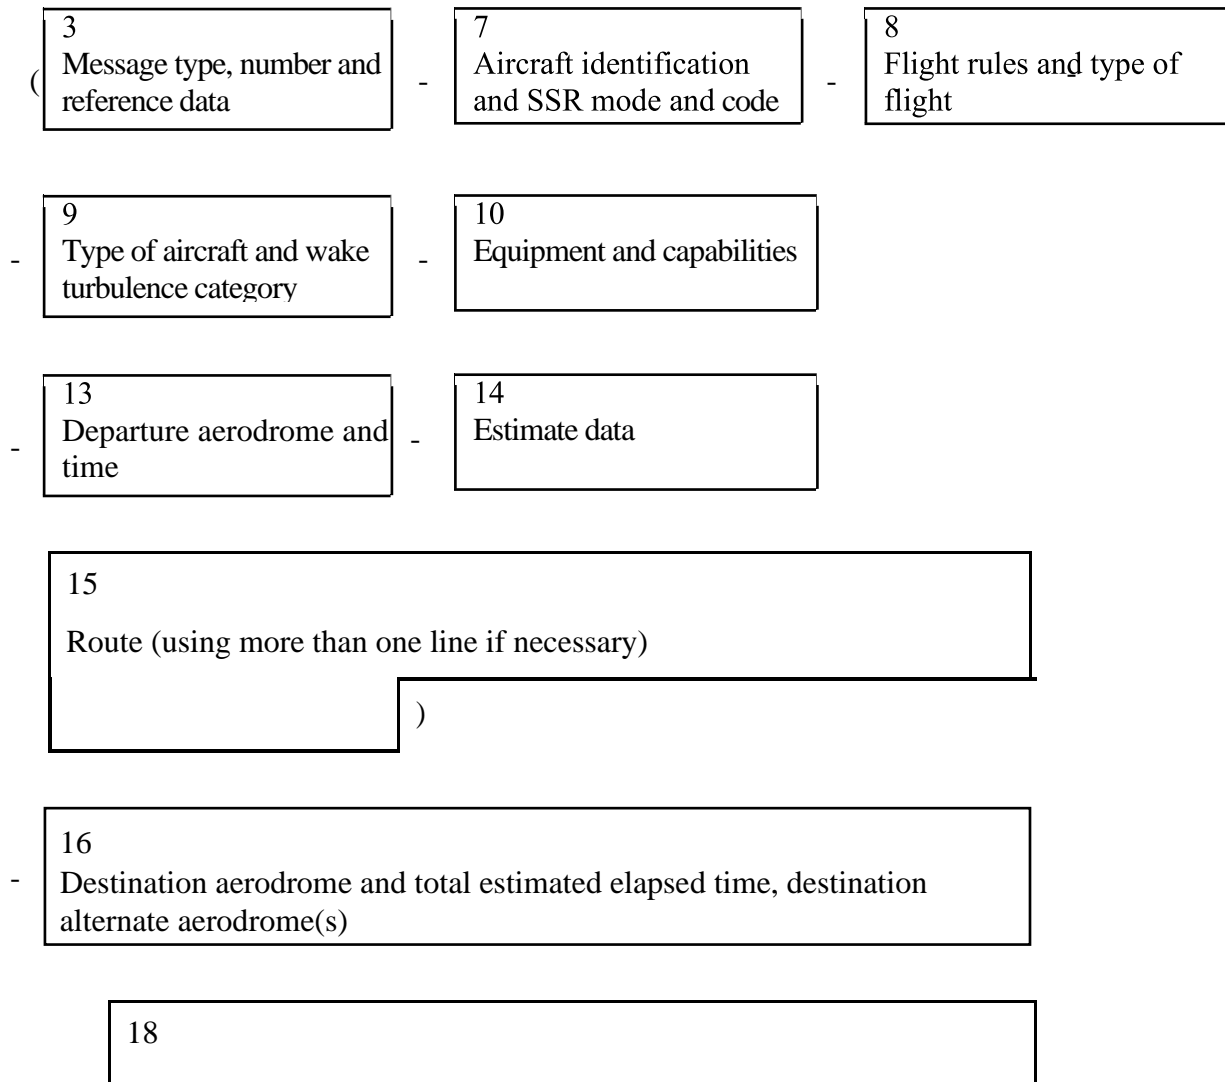

2.3.5.3.1 *Meaning*

Arrival message aircraft identification HHE13 — departed from Amsterdam at 0900 — destination Frankfurt - landed at Den Helder heliport at 1030 UTC.

1.4. Coordination messages

2.3.6 *Current flight plan (CPL) message*

2.3.6.1 *Composition*

| | |
|---|---|
| - | Other information (using more than one line if necessary) |
| |) |

2.3.6.2 Example 1

The following is an example of a current flight plan message sent from Boston Centre to New York Centre on a flight which is en route from Boston to La Guardia Airport.

(CPL-UAL621/A5120-IS
 -A320/M-S/C
 -KBOS-HFD/1341A220A200A
 -N0420A220 V3 AGL V445
 -KLGA
 -0)

2.3.6.3 Example 2

The following is an example of the same current flight plan message, but in this case the message is exchanged between ATC computers.

(CPLBOS/LGA052-UAL621/A5120-IS
 -A320/M-S/C
 -KBOS-HFD/1341A220A200A
 -N0420A220 V3 AGL V445
 -KLGA
 -0)

Note.— The messages in Examples 1 and 2 are identical except that the Message Number of Example 2 does not appear in Example 1.

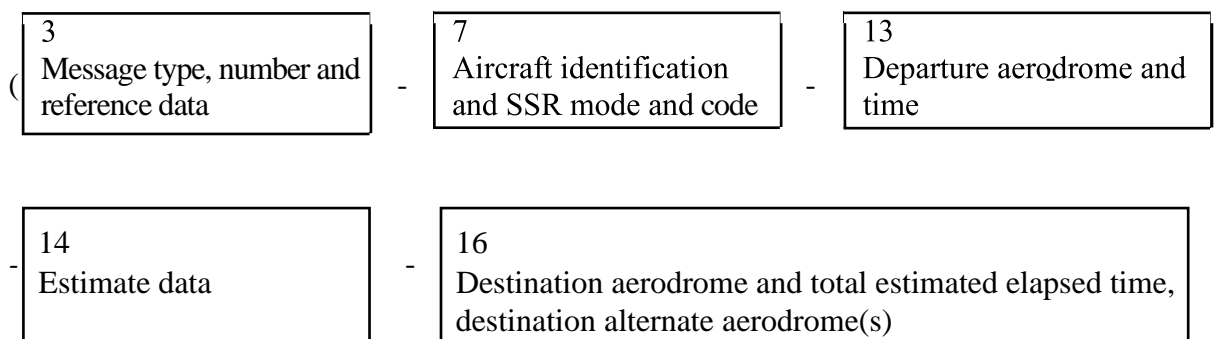

2.3.6.4 Meaning

Current flight plan message [with sending unit identity (BOS) and receiving unit identity (LGA), followed by the serial number of this message (052)] — aircraft identification UAL621, last

assigned SSR Code 5120 in Mode A — IFR, scheduled flight — one A320, medium wake turbulence category, equipped with standard communications, navigation and approach aid equipment for the route and SSR transponder with Modes A (4 096 code capability) and C — departed Boston — the flight is estimated to cross the Boston/New York “boundary” at point HFD at 1341 UTC, cleared by the Boston Centre at altitude 22 000 feet but to be at or above altitude 20 000 feet at HFD — TAS is 420 knots, requested cruising level is altitude 22 000 feet — the flight will proceed on airway V3 to reporting point AGL thence on airway V445 — destination is La Guardia Airport — no other information.

2.4.1 *Estimate (EST) message*

2.4.1.1 *Composition*

2.4.1.2 *Example*

The following is an example of an estimate message sent from Paris Centre to London Centre. It is assumed that London Centre has received a filed flight plan message relating to this flight. Both centres are equipped with computers.

(ESTP/L027-BAW671/A5631-LFPG-ABB/1548F140F110A-EGLL)

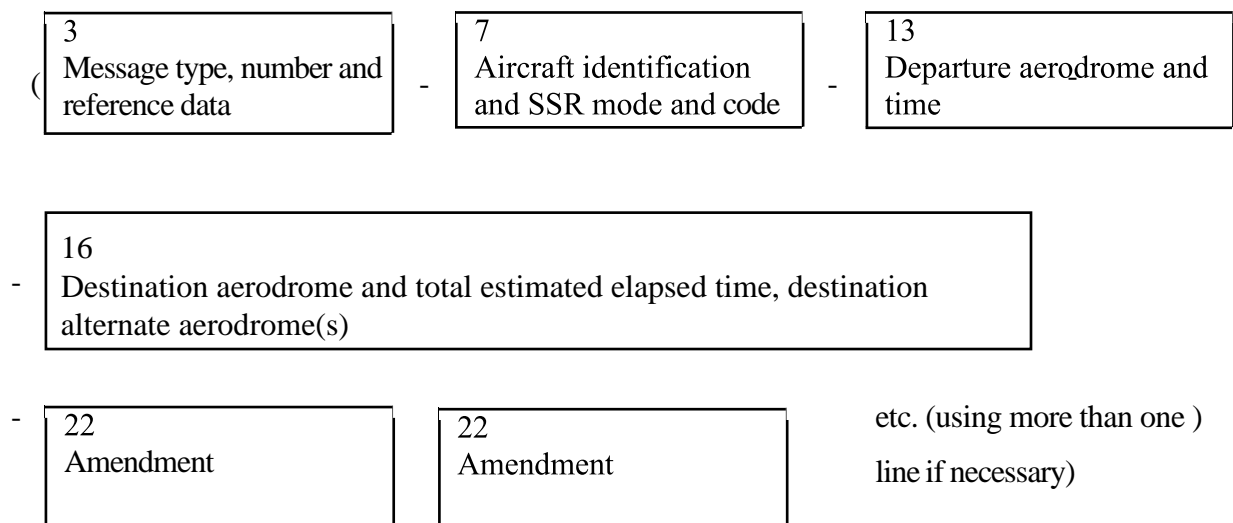

2.3.6.4.1 *Meaning*

Estimate message [with sending unit identity (P) and receiving unit identity (L), followed by the serial number of this message (027)] — aircraft identification BAW671, last assigned SSR Code 5631 operating in Mode A — departure aerodrome Paris de Gaulle — estimating Abbeville VOR 1548 UTC, cleared FL 140, flight will cross the Abbeville VOR at FL 110

or above, ascending — destination aerodrome London.

2.4.1 Coordination (CDN) message

2.3.1.1 Composition

2.4.1.3 Example

The following is an example of a coordination message sent from Prestwick Centre to Dublin Centre proposing changes to the conditions under which an aircraft should cross the Dublin/Prestwick boundary. Prestwick has received a current flight plan message from Dublin and both centres are equipped with ATC computers.

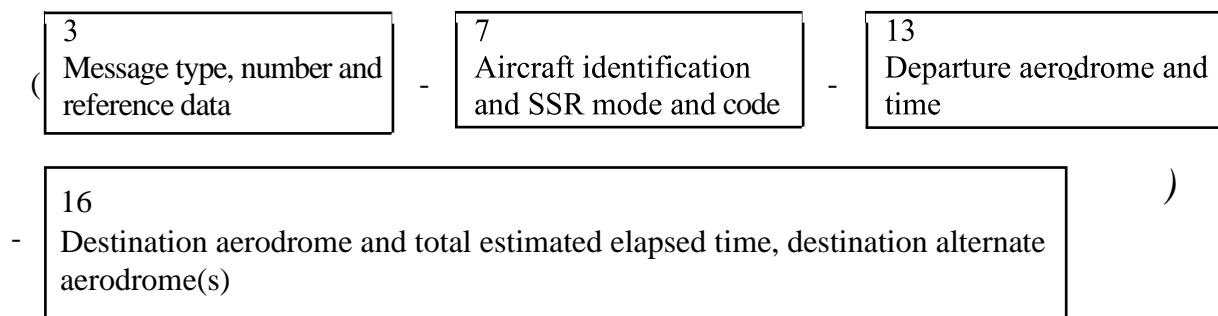

(CDNP/D098D/P036-BAW617/A5136-EIDW-EGPK-14/GRN/1735F210F130A)

2.4.1.3.1 Meaning

Coordination message — Prestwick and Dublin ATC computer unit identifiers, P and D, followed by serial number (098) of this message sent by Prestwick, followed by analogous data identifying the current flight plan message sent from Dublin to which it is related (D/P036) — aircraft identification BAW617/SSR Code 5136 operating in Mode A — en route from Dublin to Prestwick — Field Type 14 is the subject of the proposal, i.e. Prestwick will accept the flight at the boundary point GRN at 1735 UTC and crossing the boundary point at or above FL 130 climbing to a cleared level of FL 210.

2.4.2 *Acceptance (ACP) message*

2.3.1.2 *Composition*

2.4.2.1 *Example*

The following is an example of an acceptance message sent from London Centre to Paris Centre relating to a current flight plan message which London has received from Paris. It is assumed that both centres are equipped with ATC computers.

(ACPL/P086P/L142-EIN065/A4570-LFPO-EGLL)

2.4.2.1.1 *Meaning*

Acceptance message — London and Paris computer unit identifiers, L and P, followed by serial number (086) of this message sent by London, followed by analogous data identifying the current flight plan message sent from Paris, to which it is related (PL142) — aircraft identification EIN065/SSR Code 4570 operating in Mode A — en route from Paris to London — is acceptable.

2.4.3 *Logical acknowledgement (LAM) message*

2.4.3.1 *Composition*

2.4.1.1 *Example*

The following is an example of a logical acknowledgement message sent by a centre to an adjacent centre reacting to a current flight plan message. It is assumed that both centres are equipped with ATC computers.

(LAMP/M178M/P100)

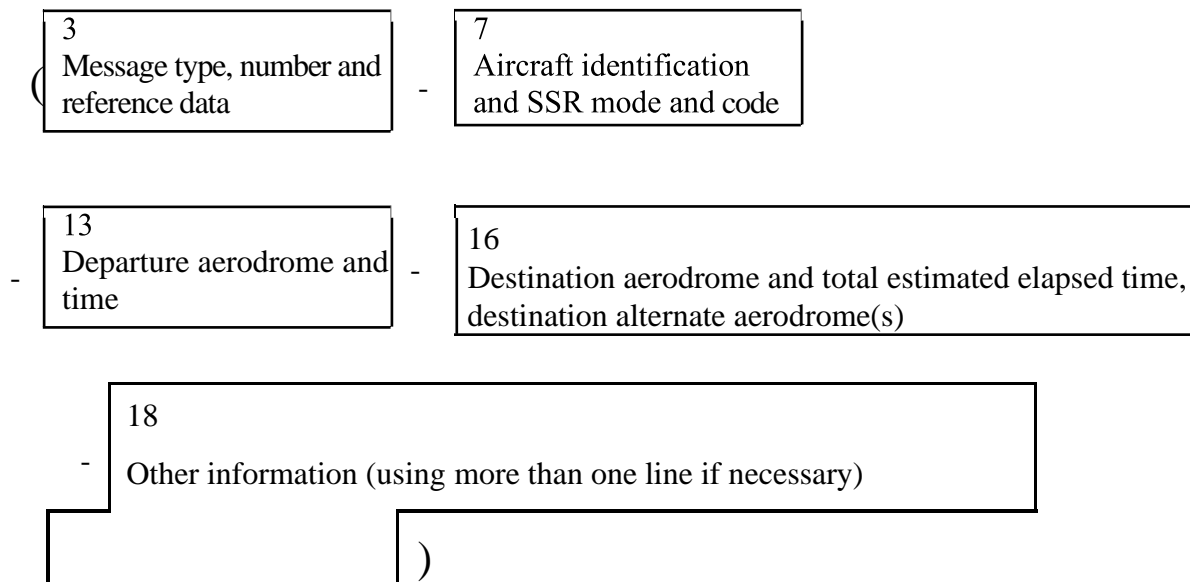

2.4.1.1.1 *Meaning*

Logical acknowledgement message — identifiers of sending and receiving ATC computer units Paris and Maastricht, followed by the sending unit serial number (178) of this message, followed by the computer unit identifiers and serial number (100) of the related estimate message.

1.5. Supplementary messages

2.4.4 *Request flight plan (RQP) message*

2.3.6.5 *Composition*

2.3.6.6 *Example*

The following is an example of a request flight plan message sent by a centre to an adjacent centre

after receipt of an estimate message, for which no corresponding filed flight plan message had been received previously.

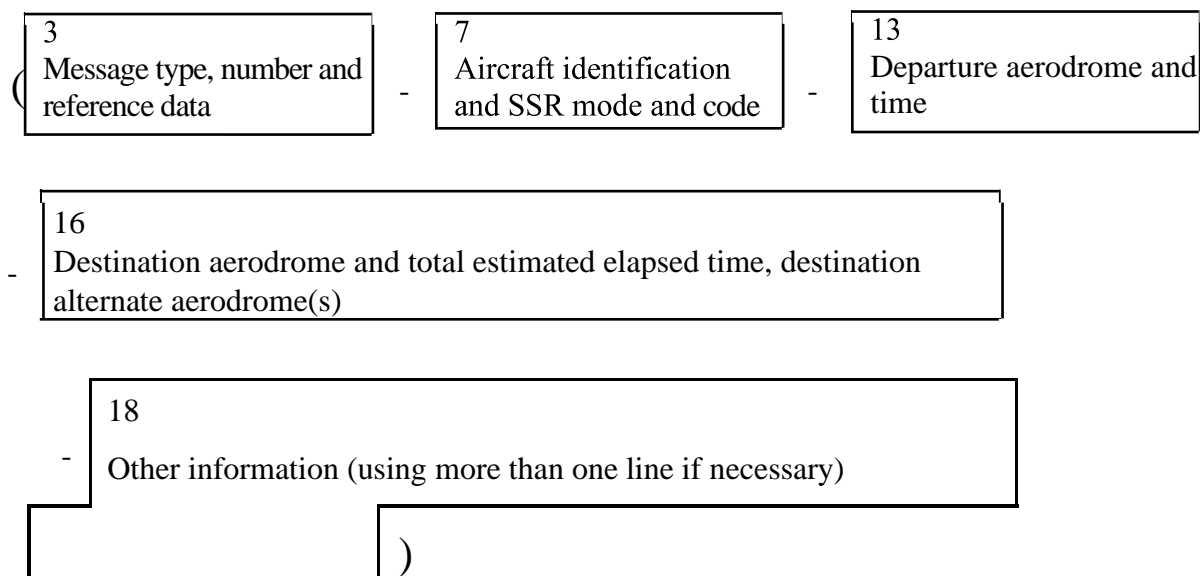

(RQP-PHOEN-EHRD-EDDL-0)

2.5.1.1.1 *Meaning*

Request flight plan message — aircraft identification PHOEN departed from Rotterdam — destination Düsseldorf - no other information.

2.4.5 *Request supplementary flight plan (RQS) message*

2.3.6.7 *Composition*

2.3.6.8 *Example*

The following is an example of a request supplementary flight plan message sent by an ATS unit to the ATS unit serving the departure aerodrome requesting information contained in the flight plan form, but not transmitted in the filed or current flight plan messages.

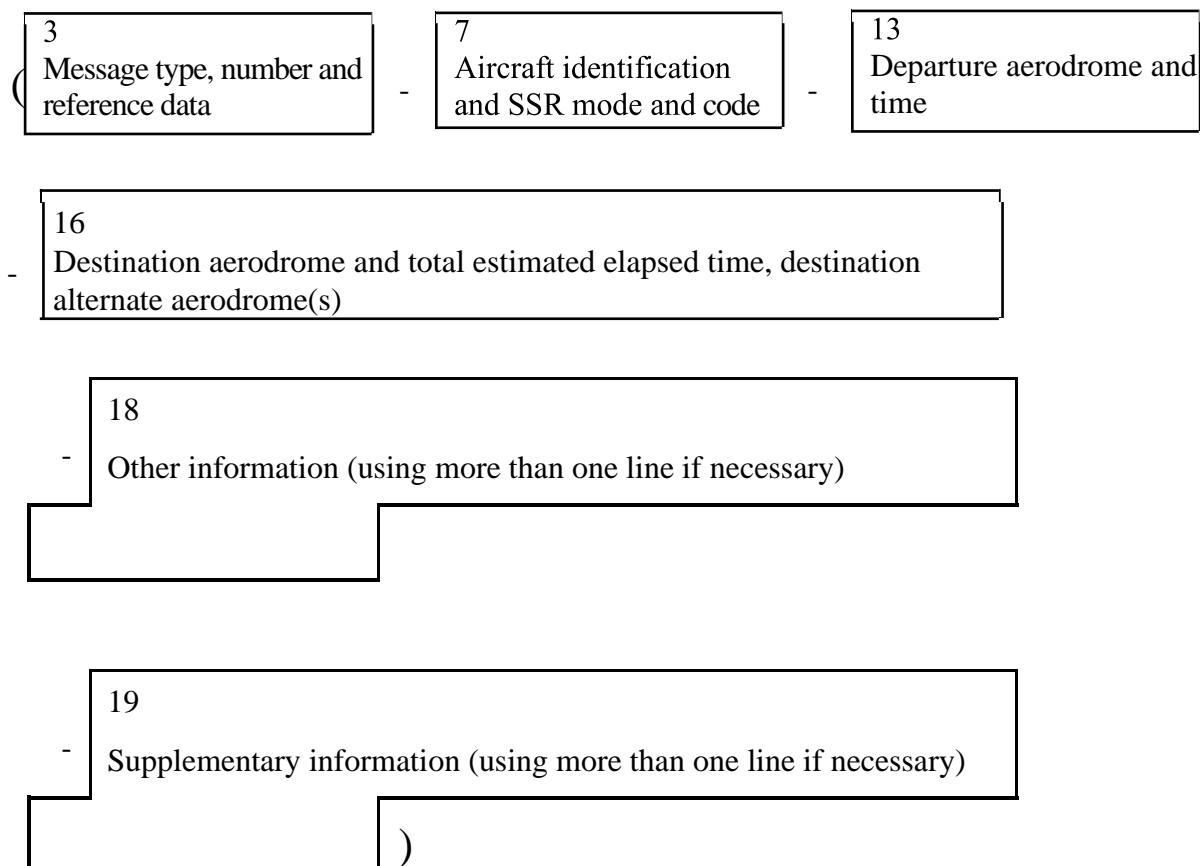

(RQS-KLM405/A4046-EHAM-CYMX-0)

2.5.1.1.2 *Meaning*

Request supplementary flight plan message — aircraft identification KLM405/SSR Code 4046 operating in Mode A — departure aerodrome is Amsterdam — destination aerodrome is Mirabel - no other information.

2.5.1 *Supplementary flight plan (SPL) message*

2.5.1.1 *Composition*

2.5.1.1 *Example*

The following is an example of a supplementary flight plan message sent by the departure aerodrome of a flight to an ATS unit which had requested supplementary information recorded on the flight plan form (but not transmitted in filed flight plan messages or current flight plan messages).

(SPL-SAW502A

-EDDW0920

-EKCH0400 EKV B
-REG/GBZTA RMK/CHARTER
-E/0640 P/9 R/V J/L A/BUE C/DENKE)

2.5.1.1.1 *Meaning*

Supplementary flight plan message — aircraft identification SAW502A no SSR — departed Bremen 0920 UTC — destination Kastrup, total estimated elapsed time 4 hours — alternate Viborg — aircraft registration GBZTA — charter flight — endurance 6 hours and 40 minutes after departure — 9 persons on board — portable radio working on International Distress Frequency 121.5 MHz is carried — life jackets fitted with lights are carried — the aircraft colour is blue — the pilot's name is Denke.

Appendix 4

AIR TRAFFIC INCIDENT REPORT

1. ICAO model air traffic incident report form
2. Instructions for the completion of the air traffic incident report form

1. ICAO model air traffic incident report form

| AIR TRAFFIC INCIDENT REPORT FORM | | |
|--|---------------------------------|------------------------|
| <i>For use when submitting and receiving reports on air traffic incidents. In an initial report by radio, shaded items should be included.</i> | | |
| A — AIRCRAFT IDENTIFICATION | B — TYPE OF INCIDENT | |
| | AIRPROX / PROCEDURE / FACILITY* | |
| C — THE INCIDENT | | |
| 1. General | | |
| a) Date / time of incident _____ UTC | | |
| b) Position _____ | | |
| 2. Own aircraft | | |
| a) Heading and route _____ | | |
| b) True airspeed _____ measured in () kt _____ () km/h _____ | | |
| c) Level and altimeter setting _____ | | |
| d) Aircraft climbing or descending | | |
| () Level flight | () Climbing | () Descending |
| e) Aircraft bank angle | | |
| () Wings level | () Slight bank | () Moderate bank |
| () Steep bank | () Inverted | () Unknown |
| f) Aircraft direction of bank | | |
| () Left | () Right | () Unknown |
| g) Restrictions to visibility (select as many as required) | | |
| () Sun glare | () Windscreen pillar | () Dirty windscreen |
| () Other cockpit structure | () None | |

h) Use of aircraft lighting (select as many as required)

- ☐ Navigation lights ☐ Strobe lights ☐ Cabin lights
☐ Red anti-collision lights ☐ Landing / taxi lights ☐ Logo (tail fin) lights
☐ Other ☐ None

i) Traffic avoidance advice issued by ATS

- ☐ Yes, based on ATS surveillance ☐ Yes, based on visual sighting
☐ Yes, based on other information system ☐ No

j) Traffic information issued

- ☐ Yes, based on ATS surveillance ☐ Yes, based on visual sighting
☐ Yes, based on other information system ☐ No

k) Airborne collision avoidance system — ACAS

- ☐ Not carried ☐ Type ☐ Traffic advisory issued
☐ Resolution advisory issued ☐ Traffic advisory or resolution advisory not issued

l) Identification

- ☐ No ATS surveillance system available ☐ Identification ☐ No identification

m) Other aircraft sighted

- ☐ Yes ☐ No ☐ Wrong aircraft sighted

n) Avoiding action taken

- ☐ Yes ☐ No

o) Type of flight plan IFR / VFR / none*

3. Other aircraft

a. Type and call sign / registration (if known)

b. If a) above not known, describe below

- ☐ High wing ☐ Mid wing ☐ Low wing

☐ Rotorcraft

☐ 1 engine

☐ 2 engines

☐ 3 engines

☐ 4 engines

☐ More than 4 engines

Marking, colour or other available details

c. Aircraft climbing or descending

☐ Level flight

☐ Climbing

☐ Descending

☐ Unknown

d. Aircraft bank angle

☐ Wings level

☐ Slight bank

☐ Moderate bank

☐ Steep bank

☐ Inverted

☐ Unknown

e. Aircraft direction of bank

☐ Left

☐ Right

☐ Unknown

f. Lights displayed

☐ Navigation lights

☐ Strobe lights

☐ Cabin lights

☐ Red anti-collision lights

☐ Landing / taxi lights

☐ Logo (tail fin) lights

☐ Other

☐ None

☐ Unknown

g. Traffic avoidance advice issued by ATS

☐ Yes, based on ATS surveillance system ☐ Yes, based on visual sighting ☐ Yes, based on other information

☐ No

☐ Unknown

h. Traffic information issued

☐ Yes, based on ATS surveillance system ☐ Yes, based on visual sighting ☐ Yes, based on other information

() No () Unknown

i. Avoiding action taken

() Yes

() No

() Unknown

4. Distance

a) Closest horizontal distance

b) Closest vertical distance _____

5. Flight meteorological conditions

a) IMC / VMC*

b) Above / below* clouds / fog / haze or between layers*

c) Distance vertically from cloud__m / ft* below____m / ft* above

d) In cloud / rain / snow / sleet / fog / haze*

e) Flying into / out of* sun

f) Flight visibility__m / km*

6. Any other information considered important by the pilot-in-command

D — MISCELLANEOUS

1. Information regarding reporting aircraft

a) Aircraft registration

b) Aircraft type _____

c) Operator

d) Aerodrome of departure

e) Aerodrome of first landing__Destination

f) Reported by radio or other means to _____(name of ATS unit) at date/time _____UTC

g) Date / time / place of completion of form _____

2. Function, address and signature of person submitting report

a) Function _____

b) Address _____

c) Signature _____

d) Telephone number _____

3. Function and signature of person receiving report

a) Function_____ b) Signature _____

E — SUPPLEMENTARY INFORMATION BY ATS UNIT CONCERNED

1. Receipt of report

a) Report received via AFTN / radio / telephone / other (specify)* _____

b) Report received by _____(name of ATS unit)

2. Details of ATS action

Clearance, incident seen (ATS surveillance system/visually, warning given, result of local enquiry, etc.)

DIAGRAMS OF AIRPROX

Mark passage of other aircraft relative to you, in plan on the left and in elevation on the right, assuming YOU are at the centre of each diagram. Include first sighting and passing distance.

* Delete as appropriate.

2. Instructions for the completion of the air traffic incident report form*Item*

- | | | |
|-------|---|---|
| A | A | Aircraft identification of the aircraft filing the report. |
| B | B | An AIRPROX report should be filed immediately by radio. |
| C1 | | Date/time UTC and position in bearing and distance from a navigation aid or in LAT/LONG. |
| C2 | | Information regarding aircraft filing the report, tick as necessary. |
| C2 c) | | E.g. FL 350/1 013 hPa or 2 500 ft/QNH 1 007 hPa or 1 200 ft/QFE 998 hPa. |
| C3 | | Information regarding the other aircraft involved. |
| C4 | | Passing distance — state units used. |
| C6 | | Attach additional papers as required. The diagrams may be used to show the aircraft's positions. |
| D1 f) | | State name of ATS unit and date/time in UTC. |
| D1 g) | | Date and time in UTC and place of completion of form. |
| E2 | | Include details of ATS unit such as service provided, radiotelephony frequency, SSR codes assigned and altimeter setting. Use diagram to show the aircraft's position and attach additional papers as required. |
